INTRODUCTION.

The present Bulletin has been prepared in response to frequent suggestions from those having occasion to use the nine Annual Reports on the Insects of Missouri, made by me, as State Entomologist, to the State Board of Agriculture, during the years 1868 to 1877, inclusive. Reports contain a good deal of matter anent the Cotton Worm, the Chinch Bug, the Rocky Mountain Locust, and other insects which the Commission has studied, and were published, as required by law, in the Annual Reports of said State Board of Agriculture for the years mentioned. That method of publication was always regretted by myself and by many others, inasmuch as the reports of the Board were generally volumes of such bulk as to delay publication and render mailing expensive. By virtue of the fact that they were distributed only to members of the State legislature and to State societies, access to them by persons outside the State of Missouri was extremely difficult; while the State printing and press-work were, as a rule, of a very unsatisfactory character. To avoid some of these difficulties it was my habit to have about 300 separate copies of the entomological portion printed on better paper, at my own expense, for distribution to correspondents both at home and abroad, and it is through these, principally, that the Reports have been accessible outside the State.

The demand for the Reports and the manner in which they have been used and commended by subsequent writers can but be gratifying to the author, who feels that whatever of commendation they deserve is due to the fact that they embody results of original investigation. They contain some matter that, with present light, he would expunge, and the earlier volumes, more particularly, contain imperfections which no one appreciates more fully than himself. Many of these are attributable to isolation from other working entomologists at the time, as well as to the almost absolute dearth of entomological works of reference in any of the libraries of Saint Louis.

The general plan of the Reports, which were addressed to the intelli-

gent cultivator of the soil rather than to the naturalist, is set forth in the following passage from the introduction to the first:

Fully aware that I write for those who, as a rule, are unversed in entomology, I have endeavored to treat of each insect with as little of the nomenclature of science as is consistent with clearness of expression. Yet, as much that is of scientific interest, such as descriptions of new species, must necessarily be inserted, I have had such descriptions printed in a type of smaller size than the text, so that it can be skipped if desirable, at the time of reading, and easily referred to for comparison, with specimens which one is desirous of naming. I have also endeavored to illustrate, as far as possible, the insects of which this report treats, believing that good illustration forms the basis of successful teaching in a science with which the general husbandman is not expected to be acquainted; for the eye conveys to the mind, in an instant, what the ear would fail to do in an hour. The practical man cares little to what genus or family an insect belongs, so long as he can tell whether it be friend or foe. He must become familiarized with the insects about him without having necessarily to overcome scientific detail and technicality.

I have made no effort at a systematic arrangement of the insects treated of. Indeed, that were useless for the purpose in view; but, in order that the reader may refer the more readily to any particular insect which interests him, I have separated them into three series—NOXIOUS, BENEFICIAL, and INNOXIOUS—and attached a very full index. For the benefit of those who are making a study of entomology, I have also given, with each species, the Order and Family to which it belongs, in parenthesis under each heading.

So far as possible, I have used a common name for each insect, knowing that the scientific name is remembered with greater difficulty, and is, consequently, distasteful to many. But as popular names are very loosely applied, and the same name often refers to different insects, in different localities, a great deal of confusion would ensue without the scientific name, which is, therefore, invariably added, for the most part, in parentheses, so that it may be skipped without interfering in any way with the sense of the text.

In order to add value to this general index, I have brought together tables of contents of the nine volumes and given corrections and some notes and additions. I have also reproduced the descriptions of new species, and added a list of descriptions of adolescent states, of descriptions of species not new, of illustrations by reports, of illustrations by classification, and of food-plants.

The Reports were independently paginated, and the separate copies were often distributed before the Agricultural Report was off the press. The date of publication and distribution is given for each in the tables of contents. The nomenclature of the Reports is retained in this Bulletin, the synonomy being indicated in the notes and additions and with the reproduced descriptions. The name of the author of the species and not of the genus was always given as authority, and in the later Reports I endeavored to indicate whether or not the insect was described under the generic name which it bears, by adding the authority without a comma when the specific name is coupled with the generic name under which it was first published — e. g., Phycita nebulo Walsh — but placed it in parentheses when a different generic name was used than that under which the insect was first described — e. g., Acrobasis nebulo (Walsh) — except where the whole name was already in parentheses when a comma

was used for the same purpose—e.g. (Acrobasis nebulo, Walsh). The same plan is adopted throughout this Bulletin.

It had always been my intention to publish a tenth volume and to end the decade with a review of, and general index to, the whole series. Indeed, an appropriation for the tenth year's work was made and the tenth report would have been duly issued had I not been called at the time to my present work for the General Government. This Bulletin is, in a measure, the fulfillment of that intention, and is issued in the hope that it will render the Reports more serviceable to the student of insect life and to those having to deal with insects injurious to agriculture.

My thanks are due to Messrs. E. A. Schwarz and W. H. Patton, agents of the Commission, for aid in its preparation.

C. V. R.

Washington, D. C., March 1, 1881.

TABLES OF CONTENTS.

Neither of the first five volumes contained a table of contents, the plan of giving such having been adopted with the sixth. Most of these tables are, therefore, prepared for this Bulletin, while those of the Sixth and Seventh Reports are amplified. Those of the last two volumes are reproduced as they were originally made.

REPORT I.

[Submitted December 2, 1868; published March, 1869.]	Page.
Introductory	3
NOXIOUS INSECTS.	
The Bark-lice of the Apple-tree Two species known to occur in the United States, 7—Harris's Bark-louse not numerous enough to do material damage, 7. The Oyster-shell Bark-louse* Difference in the scales of the two species, 7—Introduction of the Oyster-shell Bark-louse from Enrope and its spread in the United States, 8—Precautionary measures to prevent its introduction into Missouri, 8—Its habits studied by different observers in 1867, 9—Seasonal notes on the development of the insect, 10—Only one annual brood in Missouri, 12—Formation and nature of the scale, 12—Rare occurrence of males, 14—Difference of opinion among observers as to the mode of growth of the scale, 14—Difficulty of explaining the spread of the insect from one tree to another, 15—Its occurrence upon other kinds of trees, 15—Natural enemies, 16—Artificial remedies, 16—Examination of young trees before planting, 16—Washing with alkalies, etc., 17—Scrubbing the branches with a stiff brash, 17—Funigating, 17—Application of sheep-manner, 17—Washes in general ineffective, 17—The insect can most successfully be fought during three or four days of the year only, 18.	7
The Periodical Cicada Its singular life history, 18—Seventeen and thirteen year races, 19— The two races not distinct species, 19—Two distinct forms occurring in both broods, 20—Season of their appearance and disappearance, 22—Natural history and transformations, 22—Elevated chambers of the pupa, 22—The larvie frequently occurring at great depth in the ground, 24—The operation of emerging from the pupa, 24—Only the males are capable of singing, 24—Trees in which the females deposit their eggs, 24—Mode of oviposition, 24—The newly hatched larva, 25—The W on the wings of the Cicada, 25—Enemies, 26—Fungus infesting the imago, 26—The sting of the Cicada, 26—Wide-spread fear of the insect on ac-	18

imago, 74.

	Page.
The Periodical Cicada—Continued.	
count of its supposed stinging powers, 26—Explanations of the sting,	
27 — Injury caused by the insect, 29 — by the larva, 29 — by the imago,	
29—Fruitless attempts to stop the injury, 30—Chronological table of	
all well-ascertained broods in the United States, 30 — The insect will	
appear during the next 17 years somewhere in the United States every	
year except in 1873, 41 - Number of broods that will appear in the next	
17 years in the different States, 42.	
Apple-tree Borers	42
The Round-headed Apple-tree Borer	42
It is more numerous in trees on high land than on low ground, 42 — Extent	
of its injury, 43—Its larva, 43—Appearance of the imago, 43—The	
hole made by the young larva, 44 — It remains nearly three years in the	
larva state, 44 – Its pupa state, 44 – Remedies, 45 – Alkaline washes,	
45 — Killing the larva by hot water, 45 — Cutting out the larva, 46.	
THE FLAT-HEADED APPLE-TREE BORER	46
Differences between it and the foregoing species, 46 — Habits of the beetle,	
47 — Amount of injury caused by it, 47 — Parasite attacking it, 47 —	
Remedies, 47.	
The Peach Borer	47
Its nature, 47 — Differences in the sexes, 43 — Remedies, 48 — The mound-	
ing system the best remedy, 48—Testimony as to the value of the	
mounding system, 48—Other remedies, 49.	
The Plum Curculio	50
Difference of opinion among authors on some points in its natural history,	
50 — Reasons for this difference of opinion, 51 — Facts in its natural	
history, 52—It causes the spread of the peach-rot, 52—Fruit trees at-	
tacked and those not attacked by it, 53 — It may hibernate as larva or	
pupa, but does generally as imago, 53—Mode of egg-laying, 54—It	
has one annual brood, 55 - Walsh's experiments to show that it is two-	•
brooded, 55 - Natural remedies, 56 - No parasites known to infest it,	
56 - Enemies, 57; The Pennsylvania Soldier-beetle, and its larva, 57;	
Lacewing-larva, 57; The Subangular Ground-beetle 58; Ground-bee-	
tle larva, probably of the Pennsylvania Ground-beetle, 59 — Hogs as	
Curculio destroyers, 59 - Artificial remedies. 60 - Jarring the trees the	
most effectual method, 60 - Dr. Hull's Curenlio catcher 60 - Lessons	
for the fruit-grower from the account of the Curculio, 62.	
The Codling Moth or Apple Worm	62
It is common wherever apples are grown, 62 - Description of the insect in	
its different states, 63—Its life-history, 63—Other fruits attacked by	
it, 64—Remedies, 65—Picking up the fallen fruit, 65—Entrapping	
the worms the best remedy, 66 - Trimble's hay band system and how	
to apply it, 66 — Attracting the moth by fires, 67.	
Cut-worms	67
The natural history of twelve distinct species, 67 — Definition of the term	
"Cut-worm", 67 — Habits of Cut-worms, 67 — Their natural history	
briefly given, 68 — Difficulty of breeding them in captivity, 69 — Climb-	
ing Cut-worms, 69 - Injury done by them to orchards, 69 - Fruit trees	
and shrubs they attack, 70 — They attack large trees, 71.	
THE VARIEGATED CUT-WORM	72
The full-grown larva, 72 — The eggs, 72 — Habits of the larva, 72 — Cut-	
worm moths deposit their eggs on the leaves and not on the ground,	
73 - The imago, 73 - Description of the insect as larva, pupa, and	

m	Page.
Cut-worms—Continued.	~ .
THE DARK-SIDED CUT-WORM. General characters of the larva, 74 — Habits of, and injury done by it, 75 — Description of the imago, 75; of the larva and chrysalis, 76.	74
THE CLIMBING CUT-WORM	76
Injury done by the larva, 77 — General characters of the larva, 77; of the moth, 78 — Description of the larva, 78; of the imago, 78.	• • •
THE W-MARKED CUT-WORM	79
General characters of the larva, 79 — Plants it attacks, 79 — Characters of the moth, 79 — Description of the larva and chrysalis, 79.	
THE GREASY CUT-WORM	80
The larva very variable in coloration, 80—Its injury to tomato and to- bacco plants, 80—General characters of the moth, 80—Description of larva, chrysalis, and imago, 81.	
THE WESTERN STRIPED CUT-WORM	81
Resemblance of its larva to that of the Corn Rustic, 81 — General characters of the worm and moth, 82 — Description of the larva, 82.	
THE DINGY CUT-WORM	82
Difference between it and the foregoing species, 82—General characters of pupa and imago, 82—At least three species of our Cut Worms are difficult to distinguish, 83—Description of larva, chrysalis, and imago,	
83.	ക്ക
THE GLASSY CUT-WORM Habits and general characteristics of the larva, 83—Characteristics of the moth, 84—Description of larva and chrysalis, 84.	83
THE SPECKLED CUT-WORM	84
Characteristics and habits of the insect, 84 — Description of larva, chrysalis, and imago, 85.	
THE SMALL WINTE BRISTLY CUT-WORM	86
Habits of the worm, 86—Characteristics of the moth, 86—Description	
of larva, chrysalis, and imago, 86.	
OTHER CUT-WORMS	87
87. THE WHEAT CUT-WORM	87
Injury caused by it, 87 — Description of the larva, 88.	67
REMEDIES AGAINST CUT-WORMS	89
Natural enemies, 89; Microgaster militaris, 89; Paniscus geminatus, 89; The Spined Soldier-bug, 89; The Cut-worm Lion, 89—Other enemies, 90—Artificial remedies for climbing cut-worms, 90; for common field	
cut-worms, 91.	91
General remarks, 91 — Number of species affecting the Potato, 92.	371
THE STALK-BORER	92
Habits of the larva and imago, 92 — Remedy, 93.	
THE POTATO STALK-WEEVIL	93
Its geographical distribution, 93 — Its habits, 93 — Remedy, 95.	
THE POTATO- OR TOMATO-WORM	95
It cannot sting with its horn, 95—Its chrysalis, 95—How the imago differs from the Tobacco-worm Moth, 95—Remedies and parasites, 96.	
BLISTER-BEETLES	97
The Striped Blister-beetle, 96—The Ash-gray Blister-beetle, 97—The Black-rat Blister-beetle, 98—The Black Blister-beetle, 98—The Margined Blister-beetle, 98—Synonymical remarks, 98—Remedies for Blister-beetle, 98—Synonymical remarks, 98—S	
ter-beetles, 99.	

Insects infesting the Potato—Continued.	Page.
THE THREE-LINED LEAF-BEETLE	99
Merdigerous habit of the larva, 99-It has two annual broods, 100-	
Other notes on the habits of the insect, 100.	
THE CUCUMBER FLEA-BEETLE	101
The Colorado Potato-beetle	101
Its past history and future progress, 101—Its native home, 101—Its gradual spread eastward, 102—Its confusion with the Bogus Colorado Potato-beetle, 103—How the two species differ in habits, 104; in their larval states, 104; in the egg-state, 105—Description of the larva of Doryphora juncta, 106—Differences in the images of the two species, 106—Habits of the Colorado Potato-beetle, 107—When it appears and dis-	
appears, 107 — Number of eggs laid by each female, 107 — Food-plants, 107 — Singular fact that <i>D. juncta</i> has not acquired the habit of attacking the Potato, 108 — Natural remedies, 109 — Complicated economy of nature, 109 — Decrease in the number of Potato-beetles on account of increase in the number of parasites, 109 — The Colorado Potato-beetle parasite, 111 — Its general character and habits, 111 — Description of <i>Lydella doryphora</i> , 111 — Ladybirds and their larva, 112 — The Spined	
Soldier-bug, 113—The Common Squash-bug erroneously considered an enemy of the Potato-beetle, 113—The Bordered Soldier-bug, 114—The Many Banded Robber, 114—The Rapacious Soldier-bug, 114—The Virginia Tiger-beetle, 115—The Fiery Ground-beetle, 115—Blister-beetles, 115—The larvæ not touched by fowl, 115—Artificial remedies, 116—Ineffectiveness of mixtures tried, 116—Killing the beetle early in spring, 116—Pincers for crushing the insect, 116—Benson's machine, 116—Proper choice of varieties of potatoes, 117—The pest will overrun the Eastern States, 117—Carelessness in transmitting specimens of	
the beetle, 117.	
Three distinct kinds of rots affecting the roots of Apple-trees, 118—The Root-louse the cause of one of these rots, 118—The cause of the other rots still hidden, 119—The Root-louse especially injurious in southerly latitudes, 119—It occurs also on other parts of the tree besides the root, 120—Description of the winged louse, 120—Fitch's description of the winged form refers to another species, 120—The Root-louse belongs to the genus *Eriosoma*, 121—Natural enemies, 121; Chalcis-fly, 121; The Root-louse Syphus-fly, 121: *Scymnus cervicalis*, 122—Artificial remedies, 123.	118
The Wooly Elm-tree Louse	123
Its general appearance and habits, 123 — Description of the winged form,	
124,	
Insects Injurious to the Grape-vine	124
THE NEW GRAPE-ROOT BORER Reports on the damage caused by it, 124—Description of the larva, 126— It belongs probably to the Cylindrical Orthosoma, 126—Former accounts of the natural history of this beetle, 127—Its injury known for several years, 127—Remedies, 125.	124
THE GRAPE CURCULIO	128
Nature of the damage done by it,128—Its larva, 128—The perfect beetle, 129—No injury done by it in 1868, 129.	
The Grape-seed Curculio General appearance of the maggot, 129—Mr. Saunders' account of the damage done by it, 130.	129

Insects Injurious to the Grape-vine—Continued.	Page.
The Grape-cane Gall-curculio.	131
The Gall caused by it, 131—The larva, 131—Its transformation, 131—Description of the beetle, 132—Differences between it and a closely allied species, 132—The Gall caused by the punctures of the female beetle, 132—Remedy, 132.	
The Grape-vine Fidia	132
The Grape Fruit-worm	133
The Eight-spotted Forester. Characteristics of the larva, 136—It is not numerous enough to cause serious injury, 136—Other caterpillars resembling it, 136.	136
THE GRAPE-VINE PLUME	137
The Snowy Tree-cricket Characteristics of the insects, 138—It is injurious, 133—Nature of the injury caused by it, 138—Remedy, 139.	138
The Raspberry Geometer Habits of the larva, 139—Parasite attacking it, 139—Characteristics of the moth, 139—Description of the larva, 139; of the imago, 140.	139
The Gooseberry Fruit-worm Accounts of the injury caused by it, 140 — Habits of the worm, 140 — The moth, 141 — Remedies, 141 — Description of larva, chrysalis, and imago, 141.	140
The Strawberry Leaf-roller. Extent and nature of the damage caused by it, 142—Habits of the insect, 142—Accounts of its injury in Indiana and Illinois, 142—Remedy, 143—Description of the image and larva, 143.	142
The White-marked Tussock-moth The egg-mass, 144—The larva and larval changes, 144—The full-grown larva, 145—Habits of the larva, 145—Mode of casting off the larval skin, 145—The cocoon, 146—The imago, 146—Two annual broods, 146—Food-plants, 146—Remedies, 147.	144
The Bag-worm, alias Basket-worm, alias Drop-worm Its geographical distribution, 148—Injury caused by it, 148—The egg, 148—The larva and its growth, 148—Habits of the larva, 149—The chrysalis, 149—The sex distinguishable in the chrysalis state, 149—The imago, 149—Food-plants, 150—Parasites, 150; Cryptus inquisitor, 150; Hemiteles thyridopterygis, n. sp., 150—Remedies, 151.	147
The Ailanthus-worm Injury done to the Ailanthus tree, 151 — Habits of the larva, 151 — The chrysalis, 151 — The imago, 152 — Geographical distribution, 152 — Remedy, 152 — Description of larva and chrysalis, 152; of the imago, 153.	151
The Walnut Tortrix Habits of the larva, 153—General appearance of the moth, 153—Phytophagic form of the insect on Snowberry, 153—Description of larva, chrysalis, and imago, 154; of the variety symphoricarpi, 154.	153

	Page.
The Seed-corn Maggot	154
Accounts of damage caused by it, 154—The maggot, 155—Transforma-	
tion 155 — Description of the imago, 155 — Remedy, 155 — Habits of	
Anthomyia larvæ, 156.	
The White Grub	156
Account of the damage caused by it, 156 — Injury done by the perfect in-	
sect, 157 — Résumé of its life-history, 157 — Remedies, 157 — Regularity	
in the appearance of the beetle, 158—Accounts of the fungus infesting	
the White Grub, 158.	
The American Meromyza	159
Nature of the damage cansed by it, 159—Characteristics of larva, chrys-	
alis and imago, 160 — European Diptera with similar habits, 160 —	
Remedies, 161.	101
The Sheep Bot-fly or Head-maggot.	161
The insect in its different states, 161—Its larva, 162—Pupa, 162—Char-	
acteristics of the imago, 162—Fatat results of the presence of the mag-	
got in the head of the sheep, 163 — Rabbits attacked by gad-fly, 164 — Testimony regarding the viviparons habits of the Bot-fly, 164 — Reme-	
dies, 165.	
Insect enemies of the Honey-bee	166
The Bee-moth or Wax-worm	166
General appearance of the moth, 166—There are no moth-proof bee	100
hives, 166 — Habits of the worm, 167 — How its presence in the hive may	
be recognized, 167 — Prevention and remedy, 167.	
THE BEE-KILLER	168
It is an Asilid fly, 168—Mr. Thompson's account of the fly, 168—How it	130
captures and kills bees, 168 — No remedy known, 168.	
2.0 201100 (2.0)	
BENEFICIAL INSECTS.	
The Rear-horse, alias Camel-cricket, alias Devil's Riding-horse	169
Its food, 169 — How it grasps its prey, 169 — Difference in the sexes, 170 —	
The larva, 170—The egg-mass, 170—The mode of egg-laying, 170—	
Voracions disposition of the Mantis, 171—Its beneficial influence, 171—	
Tachina-parasite of the Mantis, 171.	
INNOXIOUS INSECTS.	
The Solidago Gall-moth	173
Gall cansed by Trypeta solidaginis, 173—Gall produced by the Solidago	
Gall-moth, 173 — Its natural history, 173 — Provision of the larva for its	
protection within the gall, 174 — Previous account of the gall, 174 —	
Gall cansed by Cochylis hilarana on Artemisia campestris, 175 — Description	
of the Solidago Gall-moth as larva, chrysalis, and imago, 175 - Para-	
sites attacking it, 175; the Inflating Chalcis, 176; Eurytoma bolteri, n.	
sp., 176; Hemiteles (?) cressonii, n. sp., 177; Microgaster gelechiæ n. sp.,	
177; other parasites, 178 — Oberea larvæ intruding the gall, 178.	
The Knotweed Geometer	179
Its natural history, 179 — Description of larva and chrysalis, 179.	
The Thistle Plume	180
Work of its larva on thistle-heads, 180 — Description of the larva, chrys-	
alis and imago 180	

REPORT II.

[Submitted December 2, 1869; published March, 1870.]	3
NOXIOUS INSECTS.	
Report of the Committee on Entomology of the State Horticultural	-
Noxious insects less injurious in Missouri in 1869 than usual, 5—The Army Worm and the Grain Plaut-louse considerably injurious in Missouri in 1869, 5—The Chinch Bug and the Codling Moth less injurious, 6—A species of Thrips destroying great numbers of the Curculio, 6—Eggs of the Apple-tree Plant-louse destroyed by insect foes and birds, 6—According to Dr. Hull the "scab" in apples is caused by the Apple-tree Plant-louse, 7—The Pickle Worm doing great damage during 1869, 7—Importance of preventing the introduction of injurious insects, 7—Cultivation causes insects to multiply unduly, 8—More attention paid in Europe to injurious insects than in this country, 8. IMPORTED INSECTS AND NATIVE AMERICAN INSECTS	5
The Chinch Bug	15
It is the most injurious of all insects infesting grain, 16—Its past history, 17; it was known in South Carolina in Revolutionary times, 17; it was injurious in Missouri as early as 1854, 17; noticed in Illinois in 1840, 17; it was very injurious in Missouri in 1868, 17; but hardly noticed in 1869, 17—Probable reason why it was not noticed in Missouri in former times, 18—Why it is not injurious in Massachusetts and New York, 18—Its natural history, 18—The pupa state in the different insect Orders, 18—Time required for different insects to complete the cycle of development, 19—The Chinch Bug is two-brooded in Missouri, 19—Its winter quarters, 20—Its rapid multiplication, 20—Dr. Shimer's account of its nuptial flights, 21—It deposits the eggs underground on the roots of the plant, 21—The egg, 22—Dimorphous forms of the Chinch Bug, 22—Its destructive powers, 22—Account of its appearance in immense numbers, 23—Heading off the marching Bugs by a barrier of pine boards, 23—Heading off the marching Bugs by a barrier of pine boards, 23—Heavy rains destructive to the Chinch Bug, 24—Moisture	

season than in a wet one, 24—Dr. Shimer's theory on epidemic disease affecting the Chinch Bug, 25—Cannibal foes of the Chinch Bug, 25; several species of Ladybirds, 25; the Weeping Lacewing, 26; How the

	Page.
The Chinch Bug—Continued.	rage
Lacewing larva seizes its prey, 26; The Insidious Flower-bug, 27; the Common Quail, 28—Amount of damage done by the Chinch-bug, 28—Remedies, 28—Burning in winter the old corn-stalks and other dead stuff on and near the fields, 29—Mixing winter rye among spring wheat, 29—Intercepting the marching Bugs by fence-boards, 29—Sowing gas-lime, 30—Other remedies, 30—Bogus Chinch Bugs, 31—Several species of Heteroptera confounded with the true Chinch Bug, 31—The smell emitted by the Half-winged Bugs, 32—The Insidious Flowerbug, 32—The Ash-gray Leaf-bug and its injury to grape-vines, 33—The Flea-like Negro-bug, 33; injury caused by it to raspberry, strawberry, and garden flowers, 34—Two other species of Negro-bug, 35—Recapitulation of the natural history of the Chinch Bug, 36.	
The Army Worm	3
Four distinct caterpillars designated as Army Worms in this country, 37.	20
THE TENT-CATERPILLAR OF THE FOREST	3
THE COTTON WORM	3
Historical data on the injury caused by it, 38—The egg, 38—The worm	.,
and its habits, 39 - Mr. Lyman's incorrect account of its development,	
39 — The moth and its habits, 40 — Its hibernation, 40 — Remedies, 41.	
The Southern Grass-worm.	4
It resembles in habits the veritable Army Worm, 41.	
THE TRUE ARMY WORM	4
Its past history, 41—Rev. Powers' aecount of its invasion in the New England States in 1770, 42—Aecounts of later invasions previous to 1861, 43—Years of its appearance in Illinois, 43—The invasion of the year 1861, 44—Its appearance in Missouri in 1869, 44—Its sudden appearance and disappearance, 45—Reason for the apparently sudden appearance, 45—Army Worm years are wet with the preceding year dry, 46—Reason for the increase and decrease of the number of worms, 46—Its natural history, 47—Previous accounts of its natural history, 47—When the eggs are laid, 47—Where they are laid, 48—Misdireeted instinct in insects and birds, 48—Exceptions to the normal habit of the Worm, 48—Color of the Worm, 49—The chrysalis and imago, 49—Parasites, 50; The Red-tailed Tachina-fly, 50; Its beneficial work, 50; It infests also other insects, 50; Walsh's description of the fly, 51; It has been re-described as Exorista OstenSackenii, 51; The Yellow-tailed Tachina-fly, 51; Description of the fly, 51; The Glassy Mesochorus, 52; The Diminished Pezomachus, 52; The Military Microgaster, 52; The Purged Ophion, 53: The Army-Worm Ichneumon-fly, 53—Habits of the Army Worm and suggestions for its destruction, 53—Burning grass meadows in winter or early spring, 54—Plowing late in the fall, 54—The marching of the Worms, 54—Plants they prefer, 54—They become beneficial by devouring the chess in the fields, 55—Ditching, 55—Description of the insect as larva and imago, 56.	55
TORTOISE-BEETLES	5 5
The Clubbed Tortoise-beetle affects the Irish Potato, 56 — Its general ap-	
pearanee, 57 — Characteristics of Tortoise-beetles, 57 — Merdigerous habits of Tortoise-beetles and others of the same family, 58 — General appearance of the larvæ, 58 — Their dung parasol, 59 — Larval molts,	

59 - Egg of Tortoise-beetles, 60 - The chrysalis, 60 - Habits of and

injury done by the beetles, 60 - Remedies, 61.

	Page.
Insects infesting the Sweet-potato—Continued.	10
THE TWO-STRIPED SWEET-POTATO BEETLE	16
It seems to be confined to that plant, 61 — The larva and the use of its	
fork, 61 — Its pupa and imago, 61.	62
THE GOLDEN TORTOISE-BEETLE	0.2
beetle, 62.	
THE PALE-THIGHED TORTOISE-BEETLE	63
It is hardly distinguished from the foregoing species, 62.	00
THE MOTTLED TORTOISE-BEETLE	63
Characteristics of the beetle, 63—of the larva, 63.	
THE BLACK-LEGGED TORTOISE-BEETLE	63
Characteristics of imago and larva, 63.	
The Pickle Worm	64
OTHER INSECTS INFESTING CUCURBITACEOUS VINES	64
The Squash Borer, 64 — It seems to be confined to the Eastern States, 64 —	
The Striped Cucumber-beetle, 64 — Injury done by the beetle, 64; by the	
larva, 65 — The larva and pupa, 65 — Number of annual generations,	
65 — Remedies, 66 — Extent of the injury caused by it, 66 — The 12-	
Spotted Diabrotica, 66.	
THE PICKLE WORM.	67
Characteristics and description of the worm, 67—Its habits, 67—Charac-	
teristics of the moth, 68—Accounts of injury done by the worm in Mis-	
souri and Illinois, 69; in other portions of the country, 70 — It was not	
known before as injurious, 70 — Remedy, 70. Insects injurious to the Grape-vine	71
THE Hog Caterpillar of the Vine.	71
The egg, 71 — Characteristics of the larva, 71 — Its habits when about to	
transform, 72—The chrysalis and imago, 72—It is one-brooded North	
and two-brooded further South, 72—It is very injurious, 73—The Mi-	
crogaster parasite and its development, 73 — Habits of caterpillar in-	
fested with the parasite, 73.	
THE ACHEMON SPHINX	74
Appearance and habits of the larva, 74 — The chrysalis, 75 — The insect	
is single-brooded, 75 — The moth and its issuing from the pupa shell,	
75 — No parasites known, 76.	
THE SATELLITE SPHINX	76
How to distinguish its larva from that of the foregoing species, 76—De-	
velopment of the larva, 76 — Variations in color of the larva, 77 — Its	
position when at rest, 77—The moth, 78.	78
The Abbot Sphinx. Its distribution, 78—The larva varies much in color, 78—The chrysalis	10
and image, 79.	
THE BLUE CATERPILLARS OF THE VINE	79
The Eight-spotted Forester, 80 — Larva previously mistaken for it, 80 —	••
habits and characteristics of the larva, 80 — Harris's description of the	
larva, 81 — The moth, 81 — Mr. Andrews' account of its ravages, 81 —	
Remedies, 82.	
The Beautiful Wood Nymph, 83 — Characteristics of the moth, 83 — Close	
resemblance between the larva of this and the foregoing species, 83-	
The differences pointed out, 83 — Development of the insect, 83.	
The Pearl Wood Nymph, 83—It greatly resembles the Beautiful Wood	
Nymph, 83—Its probable larva, 84—Practical importance of distin-	
guishing these closely allied species, 84.	

Threats in invitant to the Change wine. Clauding all	Page
Insects injurious to the Grape-vine—Continued. THE AMERICAN PROCRIS	0
Work of its larva, 85—Description of full-grown larva, 86—The moth,	8
86—It is not very destructive, 86—Two annual broods of the insects,	
86—Parasite of the American Procris, 87.	
THE NEW GRAPE-ROOT BORER	81
Correction of opinion formerly expressed, 87.	Ų,
The Broad-necked Prionus, 87 — Duration of the larva state, 87 — Its	
transformation, 88—It bores also in Apple roots, 88—Great damage	
done by the borcr, 83—No good remedy known, 88.	
The Tile-horned Prionus, 89 — How it differs from the foregoing, 89 — Its	
occurrence on prairie land, 90 - Small dimorphous male form, 90 - The	
larva subsists also upon the roots of herbaceous plants, 90 - Practical	
considerations, 91.	
The Grape-seed Maggot	9;
The Grape-seed Curculio larva of the first report is that of a Hymenopte-	
rous insect, 92—The perfect insect is closely allied to the Joint-worm	
Fly, 92 — Mr. Saunders' account and description of the imago, 93.	
The Canker Worm	9.
The eggs, 94 — The larva and larval changes, 95 — Importance for the or-	
chardists to recognize the true Canker Worm, 95—The Imported Elm	
leaf-beetle mistaken for it, 95 — Description of the larva, 96 — Its food-	
plants, 96—The chrysalis. 96—Only one annual brood in the latitude	
of Saint Louis, 97 — The moth and its varieties, 97 — It is less injurious	
in Missouri than in the Eastern States, 97—Remedies, 98—Classifica-	
tion of remedies proposed, 98—The trough and bandage systems, 99— Muriate of lime as remedy, 100—Jarring the tree, 101—Late fall plow-	
ing, 101—Summer plowing, 102—Efficiency of hogs, 102—Enemies,	
102; Birds, mite and parasites, 102; Ground-beetles, 103; The Fraternal	
Potter-wasp, 103.	
Cabbage Worms	104
THE SOUTHERN CABBAGE BUTTERFLY	104
Its geographical range, 104 — Injury cansed by it in Missouri, 104 — De-	
scription of the larva, 105 - The chrysalis and imago, 105 - Habits and	
other food-plants, 105.	
The Potherb Butterfly, 105 — It is a Northern species, 105 — It will very	
likely never occur in Missouri, 106 — Geographical range of insects prin-	
cipally influenced by temperature, 106 — Isontomic lines, 106 — Southern	
insects found near Saint Louis, 106.	
The Imported Cabbage Butterfly, 106 — Amount of damage caused by it in	
Canada, 107—Its spread westward, 107—It will undoubtedly spread	
to St. Lonis, 107 — The insect in Europe, 107 — History of its introduc-	
tion, 107—The insect in its different stages, 108—Its food, 108—Reme-	
dies, 109 — Parasites, 109.	110
THE CABBAGE PLUSIA	110
Characteristics and habits of the larva, 110—Its transformations, 111—Remedies, 111—Description of larva, chrysalis and imago, 111—A simi-	
lar worm occurring on thistles, 112.	
THE ZEBRA CATERPILLAR	112
Habits and characteristics of the larva, 112 — The chrysalis and the moth,	112
113—Two annual broods, 113—Food-plants, 113.	
The Tarnished Plant-bug	113
Injury caused by it to various trees and plants, 114—It is a very varia-	
ble species, 114 - Its development, 111 - No effective remedy known,	
115 Proventive measures 115	

	Page.
The Philenor Swallow-tail Its food-plant, 116—Damage done by it, 116—Characteristics and development of the larva, 116—Description of the larva, 117—The pupa, 117—The imago, 117—Prevention, 118.	116
The Cottonwood Dagger. General appearance of the larva, 119—Two annual broods, 119—Chrysalis and moth, 119—Larvæ of other species belonging to the genus Acronycta, 119—Parasites, 120—Description of larva and imago, 120—Characters and habits of other species of the same genus, 121.	119
The Missouri Bee-killer. The true scientifi name of the Nebraska Bee-killer, 121 — Wing-voins of the genera Asilus, Promachus and Erax, 122 — Description of the Missouri Bee-killer, 122 — How to destroy the flies, 123 — Habits and life-history of Asilus-flies, 123 — Description of larva and pupa of Erax Bastardi (?), 124 — Synonymical notes on the imago, 124.	121
INNOXIOUS INSECTS.	
The Goat-weed Butterfly. Its geographical distribution and position in classification, 125—Its foodplant, 125—Habits of the larva, 126—Larval changes, 126—Conformity in the color of the larva with that of the leaves, 127—Description of the full-grown larva, 127—Transformation of the larva to chrysalis, 127—The two sexes of the imago, 127—Hibernation, 128.	125
The Black Breeze-fly	128
Breeze-flies beneficial in the larva state, 128—Tormenting power of Breeze-flies, 128—Their mode of flight, 129—Our knowledge of their larval character and habits, 129—General characters of the larva of the Black Breeze-fly, 129—It is semi-aquatic, 129—Walsh's description of the larva, 130—Habits and food of the larva, 130—Its transformations, 131—Discription of the pupa, 131—Probable habits of Breeze-fly larvae on the Western prairies, 132.	
Galls made by Moths	132
The False Indigo Gall-moth The gall and its structure, 132—General appearance of the larva and the moth, 133—Description of larva and imago, 133.	132
THE MIS-NAMED GALL-MOTH	134
Is it a true gall-maker or an inquiline?, 134—Walsh's description of the larva, 134—Description of the imago, 134—Generic characters, 134—Reasons why the insect is an intruder and not a gall-maker, 134—Enumeration of the known gall-making moths, 135—How the gall is formed, 135.	104
REPORT III.	
[Submitted December 2, 1870; published April, 1871.]	
Preface	3
NOXIOUS INSECTS.	
The whole vegetable kingdom and every part of each plant serve as food for insects, 5—Enumeration of insects affecting the different parts of the Apple-tree, 5—Other food-habits of insects, 7—Vast extent of the science of entomology, 8—Beauty and simplicity of classification in entomology, 8—Each family distinguished by its general appearance, 8—Unity of habits in each family, 9—Distinguishing characters of Snout-beetles, 9—Their larvæ, 10—They are among the most injurious beetles, 10—Injurious Snout-beetles in Europe, 11.	5

Snout-beetles—Continued.	Page.
THE COMMON PLUM CURCULIO.	11
It is single-brooded, 11 — Experiments to prove this fact, 12—It hiber-	11
nates as beetle, 13—Form of the egg, 13—Feeding habits of the beetle,	
13 — Creaking noise produced by it, 14 — Stridulation in other insects, 14	
-It is nocturnal rather than diurnal, 14 - Habits of the beetle at night,	
14—Remedies, 15—The Ransom Chip-trap process, 15; explanation of	
the process, 15; it is not so successful as anticipated, 15; it is not a new	
discovery, 16; number of Curculios caught by it, 16; its success depend-	
ent on the character of the soil, 17; directions for using the process, 17;	
more experiments needed, 17 — Offering premiums for collecting speci-	
mens, 17 — Absurdity of the application of Paris Green for the Curculio,	
18 - Jarring by machinery, 18 - The Hull Curculio-catcher defective in	
several respects, 18 — The Ward Curculio-catcher, 20; how it could be	
improved, 20; rules for using the machine, 21 — Curculio-catcher in-	
vented by Claxton & Stevens, 22 — Hooten's Curculio-catcher, 22; its	
advantages and mode of operation, 24 — Two true parasites of the Plum	-
Curculio, 24 — The Sigalphus Curculio parasite, 24; Fitch's account of	
it, 25; Walsh's doubt about its being parasitic on the Curculio, 25; ex-	
periments and observations proving that it is a parasite of the Curculio,	
25; its development and frequent occurrence around St. Louis, 25; it	
attacks also other soft-bodied larvæ, 26; points in its natural history,	
26; its position in the system, 27; description of the imago, larva, pupa,	
cocoon and of the var. rufus, 27 — The Porizon Curculio parasite, 28; how	
it differs from the foregoing, 28; description of the imago, 28—Import-	
ance of the work of these parasites of the Curculio, 29 — Artificial prop-	
agation and distribution of parasites, 29.	29
THE APPLE CURCULIO How it differs from the Plum Curculio, 30 — Its natural history, 30 — Food-	23
plants, 30 — The punctures it drills into the fruit, 31 — The egg, 31 — The	
larva and its habits, 31—The larva transforms within the fruit, 32—	
Amount of damage it does, 33—How its work in the fruit can be dis-	
tinguished from that of other insects, 33—It is very injurious in South-	
ern Illinois and parts of Missouri, 33—It is less injurious to apples than	
the Plum Curculio, 33 — Injury done by it to pears, 33 — The rot in apples	
principally produced by it and by the Plum Curculio, 34 - Season of its	
appearance, 34 — Remedies and preventive measures, 34 — Description	
of larva and pupa, 35.	
The Quince Curculio.	35
Its food-plants, 35 — It is very injurious to the quince in the East, 36 — Dr.	
Trimble's account of the damage done by it, 36 — How the beetle differs	
from the two preceding Curculios, 36—Its transformations and habits,	
37 — Its puncture on the fruit, 37 — It hibernates in the larva state, 37 —	
Its larva mistaken by Dr. Fitch for that of the Plum Curculio, 38—The	
imago state lasts only two months, 38—It does not attack the Apple,	
38—Remedies, 38—Description of the larva and pupa, 39.	90
THE PLUM-GOUGER.	39
How it differs from the preceding species, 39 — Injury caused by it, 39 — Food-plants, 40 — It is often mistaken for the Plum Curculio, 40 — Sea-	
son of its appearance, 40 — Holes bored by it in the fruit, 41 — The larva	
lives within the kernel of the fruit, 41 — Remedies, 41.	
THE STRAWBERRY CROWN-BORER	42
Distribution of the insect, 42 — Injury done by it, 42 — Habits and charac-	
ters of the larva, 43—Habits of the beetle, 43—Remedies, 43—Para-	

site, 44 - How the larva differs from that of the Grape-vine Colaspis,

44 - Description of the imago and larva, 44.

	Page.
Snout-beetles—Continued.	44
Insect enemies of the garden pea, 44—Characters of the Bruchides, 45—Habits of other species of Bruchide, 45—Frequent occurrence of its larva in green peas, 45—Characteristics of the beetle, 46—It is in all probability an indigenous North American insect, 46—The beetle does not sting the peas, 46—The eggs are fastened by the female beetle on the outside of the pod, 47—The larva and its habits, 47—Its transformations, 47—Remedies and preventives, 48—Examination of peas intended for seed, 48—Concerted action necessary to exterminate the insect, 48—Mr. Saunders' account of the occurrence of the Pea-weevil in Canada, 49—Other preventive measures, 49—Birds destroying the insect, 50.	44
The Grain Bruchus	50
- Curtis' account of its habits in Europe, 51.	50
THE AMERICAN BEAN-WEEVIL. Food-plants, 52—Its geographical distribution, 52—Accounts of damage done by it in New York and Pennsylvania, 52—It has only lately become injurious, 53—Habits of the larva and beetle, 54—The proper nomenclature of the species, 54—Description of the imago, 55—Its differences from allied species, 54—Note on descriptions based upon individual variations, 56.	52
THE NEW YORK WEEVIL	57
Damage caused by it to fruit trees, 57 — Former descriptions of the insect, 57 — Its breeding habits, 57 — The Pear Blight not caused by the beetle, 58.	
THE IMBRICATED SNOUT-BEETLE	58
Injury done by it to vegetation, 58—Its natural history still unknown, 58—General appearance of the beetle, 58.	
THE CORN SPHENOPHORUS.	59
Damage caused by it to corn plants, 59 — Characteristics of the beetle, 59 — Its larval history still nuknown, 59 — Probable habits of the larva, 59—Walsh's description of the imago, 59.	
THE COCKLEBUR SPHENOPHORUS.	60
It is not injurions, 60 — Coloration of the beetle and its probable identity with S. 13-punctatus, 60 — The larva, 60 — Ennmeration of other injurious Snout-beetles, 60.	
insects injurous to the Grape-vine	61
The Grape Leaf-folder Its geographical distribution, 61 — Generic characters, 61 — Characters of	61
the moth, 61 — Sexual differences, 62 — Habits of the larva, 62 — Rem-	
edy and prevention, 62—Natural enemies, 62—Description of the	
larva, 62.	CO
THE GRAPE-VINE EPIMENIS Its larva formerly mistaken for that of the Pearl Wood Nymph, 63 — Char-	63
aeters of the moth and sexual differences, 63—Habits of the larva when	
about to transform, 64—Its grape-vine feeding habits formerly nn-	
known, 64 — Description of the larva, 64; of the chrysalis, 65.	
THE GRAPE-VINE PLUME	65
Work of its larva and of that of the Grape-vine Epimenis, 65 — Both larva rather beneficial when not too numerous, 65 — Characters of the larva, 66 — Peculiar form of the pupa, 65 — Protective mimiery of the pupa, 67 — Habits and appearance of the moth, 67 — Is it single or double-	
brooded, 67.	

	D
Insects injurious to the Grape-vine—Continued. THE COMMON YELLOW BEAR	Pag e. 68
How the young larvæ differ from the mature larva of the Grape-vine Plume, 68—Food-plants, 68—Color variations in the larvæ, 69—The ehrysalis, 69—The imago, 69—Parasites, 69—Remedy, 69.	
THE SMEARED DAGGER	70
The larva is polyphagous, 70 — Characters of larva, pupa, and imago, 70 — Remedy, 70 — Parasites, 71 — Description of imago and larva, 71; of the pupa, 72.	
THE PYRAMIDAL GRAPE-VINE WORM. Distinguishing characters of the Worm, 72 — Its food-plants, 72 — Its transformations, 72 — It is single or double-brooded according to latitude, 73 — Its closely allied congener in Europe, 73 — Remedies, 73 — Description of the larva, 73; of pupa and imago, 74 — How it differs from Amphipyra pyramidea, 74 — Description of larva and imago of the Spat-	
tered Copper Underwing, 75. THE GRAPE-ROOT BORER Its distribution, 75—Distinguishing characters of the larva, 76—Its transformation, 76—Characters of the moth, 76—Description of the imago and its sexual differences, 76—Work of the larva on graperoots, 77—Remedies, 77.	
THE SPOTTED PELIDNOTA It is usually not injurious, 77—The larva and its habits, 78—The beetle, 78—Description of the larva, 78.	77
The Grape-vine Flea-beetle. It is well-known to the grape-grower in Missouri, 79—Its distribution and food-plants, 80—Hibernation, 80—Damage done by the beetle in spring, 80—The eggs, 80—Damage caused by the larvæ, 80; their transformation, 80—Remedies, 80—Description of the larva and pupa, 81.	
THE GRAPE-VINE COLASPIS	
The Grape-leaf Gall-louse. Its life-history not yet fully studied, 84 — Previous accounts of the insect by Fitch, Shimer, and Walsh, 85 — The root disease in France, 85 — The Phylloxera vastatrix recognized as the eause of this disease, 85 — Identity of the gall-louse with the root-inhabiting insect, 86 — The American and European insects are identical, 86 — Remedies tried in France, 86 — The disease directly eaused by the Phylloxera, 87 — Injury done by the Phylloxera in Missouri, 87 — Forming of the gall, 87 — Propagation of the lice and multiplication of the galls, 88 — The gall-lice descend in the latter part of the season to the roots, 88 — Change of the insect after passing from the leaves to the root, 88 — Questions still to be settled in the life-history of the Phylloxera, 88 — Rare occurrence of the winged form, 89 — The insect can be transported from one place to another on roots, 89 — It hibernates on the roots, 89 — Grape-vines that should be planted, 89 — Number of indigenous species of the Grape-vine, 90 — Grape-vines which are most seriously infested with the Grape leaflonse, 90 — Danger in planting the Clinton among other grapes, 91 — In-	84

Insects injurious to the Grape-vine—Continued.	Page
sects acquiring different food-habits as illustrated in the Apple-maggot and the Pine-leaf Seale, 92—The different forms of the Grape leaf-louse, 93—Discussion on the proper place of the insect in the classification, 93—On Dr. Shimer's proposed new families Dactylosphæridæ and Lepidosaphidæ, 93—Objections to Fitch's specific name vitifoliæ, 95—Identity of the European with the American insect, 95—The Apple-root lonse is identical with the Wooly Aphis, 95—The Gall-inhabiting form of the Phylloxera identical with the root-inhabiting type, 96—Characters of the genus Phylloxera and its place in the system, 96. The Colorado Potato-beetle again. Its onward march, 97—It invades the Dominion of Canada, 97—How it crossed Lake Michigan, 97—It will probably spread through Ontario unless preventive measures are taken, 98—Excellent chance to prevent its spread in Canada, 98—The Paris green remedy, 99—It is efficient if judiciously applied, 99—It does not affect the tuber, 99—Natural checks to the increase of the Potato-beetle 100—The Great Lebia destroying the larvæ, 100—Bogus experiments, 100—The true Remedy, 101—How to prevent the insect from becoming too numerons, 101—Planting early varieties of potatoes, 101.	9
The Codling Moth again	10
Hay-bands around the trunk of the tree more effectual than rags placed in the fork, 102 — The Codling Moth is single-brooded in the more northern countries, but double-brooded in the latitude of St. Lonis, 102 — Sexual differences of the moth, 103 — Sexual characters in the genera Argynnis and Grapta, 103 — The Codling Moth also infests peaches, 103. The Corn Worm alias Boll Worm Its geographical range, 104 — Injury done by it to corn, 104 — It attacks tomatoes and other plants, 105 — Food-plants of the Stalk-borer, 105 — The egg of the Corn Worm, 105 — Mr. Glover's account of the habits of the Boll Worm, 106 — The larva is very variable in color, 107 — Its transformations, 107 — Number of annual broods, 107 — Amount of damage done by it, 107 — Remedies, 108 — Attracting the moth by sweets, 108 — Heard's moth-trap, 109.	104
The Fall Army Worm	109
Reports of its appearance in 1870, and how it was generally mistaken for the True Army Worm, 109—It was also mistaken for the Boll Worm, 111—Injury caused by it, 111—How it differs from the True Army Worm, 112—It is a very variable species in the imago state, 113—The Spiderwort Owlet-moth, and how it differs from the Fall Army Worm moth, 113—Number of annual broods and time of appearance of the Fall Army Worm, 114—The eggs and how they are deposited, 114—Preventive measures, 115—It is never injurious during two consecutive years, 115—Parasitic checks, 116—Description of the imago, 116: of the varieties and the earlier states, 117.	100
The Apple-tree Tent-caterpillar, or American Lackey-moth The web-nests of the caterpillar and importance of their destruction, 118—The egg-mass, 118—The caterpillar and its habits, 119—Trans-	11

formations of the insect, 119—The imago very variable in color, 119—Food-plants of the caterpillar, 120—Remedies, 120—Parasites and

enemies, 120.

	Page.
The egg-mass and how the eggs are deposited by the female moth, 121— Development of the larva, 122—Fitch's descriptions of the full-grown larva, 123—Confusion arising from want of uniform rule in describing larvæ, 123—The cocoon, 124—The chrysalis and the moth, 124—The web spun by the caterpillar, 124—Mr. Ferris's observations on differences in habits, appearance, and food-plants of the caterpillar, 125—Phytophagic varieties or species, 127—Food-plants of the caterpillar, 127—Its destructive powers, 127—Remedies, 128—Natural enemies and parasites, 128—Summary, 129.	121
The Fall Web-worm. It is often mistaken for the Tent-caterpillars, 130—It feeds upon almost every kind of trees and shrubs, 130—The web spun by the worm 130—General appearance of the worm, 130—The chrysalis and imago, 131—Number of annual broods, 131—Plants it prefers, 131—How it differs from the Tent-caterpillar, 132—Remedies, 132—Description of the larva, 132.	130
The Blue-spangled Peach Worm	132
Winter retreat of the larva, 132 — General appearance of the larva, 133 — Chrysalis and imago, 133 — Callimorpha restalis Packard synonymous with C. fulvicosta, 133 — Food plants, 134 — Description of the larva, 134.	10.1
The Ash-gray Pinion Food plants of the larva, 135 — Transformations of the insect, 135 — Characters of the moth, 135 — Description of larva and imago, 135 — Remarks on allied species, 136. BENEFICIAL INSECTS.	134
The Glassy-winged Soldier-bug	137
It preys upon different species of leaf-hoppers, 137 — Its larva and pnpa, 138 — How it seizes its prey, 138 — Coloration of the insect, 138 — It was never observed before to attack the leaf-hoppers of the Grape-vine, 139 — Habits of the <i>Phytocorida</i> , 139.	201
INNOXIOUS INSECTS.	
The White-lined Morning Sphinx	140
Two of our Common Butterflies.	142
The Archipus Butterfles. Synonymy of its specific name, 143—Its geographical distribution, 143—Characters of the Danaidæ, 143—Sexual differences, 143—Food plants, 144—Hibernation, 144—Two annual broods, 144—Description of the egg, 144—The larva and its larval changes, 145—How the horns of the larva become longer at each moult, 145—The full grown larva, 146—Interest attached to the metamorphoses of insects, 146—How the larva becomes a chrysalis, 147—The hardened chrysalis, 147—Duration of the chrysalis state, 147—The issuing of the butterfly, 148—Protective colors of insects, 148—Nanscous odor of the Archippus Butterfly in all its stages, 149—The Tachina-parasite of the Archippus larva, 149—Action of the parasitized larva, 149—How the Tachina larva and other insects prepare the lid of their puparia, 149—Characters of this Tachina-fly, 150—Difficulties of the study of the Tachinariæ, 150—Two forms occurring in Tachina archippivora, 150—The Butterfly often congregating in immense swarms, 151—Probable reasons of this assembling in swarms, 152.	143

Two of our Common Butterflies—Continued. THE DISHPUS BUTTERFLY Distinguishing characters of the Nymphalidæ, 153—Food plants and geographical range, 153—The egg, 153—Description of the egg, 154—Development of the larva, 154—Description of the mature and young	153
larva, 154—The insect hibernates as young larva, 155—Case prepared by the larva for its winter quarters, 155—Modifications of the case, 156—Peculiar habit of the autumnal larva, 156—Parasites, 157—Tachina-fly, 157—The Disippus egg-parasite, 157—The Disippus Microgaster, 158. MIMICRY AS ILLUSTRATED BY THESE TWO BUTTERFLIES, WITH SOME REMARKS	
Conformity of eolor between animals and their surroundings, 159 — Definition of the term "mimicry," 160 — Pungent odor possessed by the Danaide, 160 — Their mode of flight, 160 — Protection they derive from their peculiar odor, 161 — Pieride and Danaide in the Valley of the Amazon, 161 — Mimetic forms of Pieride, 161 — Explanation of the origin of mimetic forms, 162 — Mimicry between the Archippus and Disippus Butterflies, 163 — The Ursula Butterfly, 163 — Its caterpillar and chrysalis undistinguishable from those of the Disippus, 163 — Its imago has no protective color, 164 — Mr. Bennett's objections to the theory of Natural Selection producing mimetic forms, 165 — Mr. Scudder's objections, 166 — Discussion of Mr. Scudder's arguments, 167 — Mr. Murray's objections to the connection between mimetic resemblances and Natural Selection, 170 — Natural Selection not the only power producing mimicry, 171 — Reasons for discussing in this Report the theory of Natural Selection, 172 — Natural Selection involves belief in the doctrine of Evolution, 173 — Darwinism is neither irreligions nor atheistic, 174.	159
REPORT IV.	
[Submitted December 2, 1871; published April, 1872.] Preface	3
Notes of the Year	5.

Its injuries in 1871, 5 — Its appearance in great numbers in early spring, 5 - Exorbitant price of Paris green, 6 - Natural enemics of the beetle very abundant, 6 - Diminution in numbers of the beetle later in the season, 7 - Causes of such diminution, 7 - Damage caused by the Potatobeetle in Missouri, 7 — It invaded Canada in 1870, 8 — The Three-lined Potato-beetle mistaken for it in New York and Massachusetts, 8-Its further spread eastward irresistible, 8-Slow spread of the insect in the South, 9 - Its present extent northward, 9 - It spreads but does not leave the districts already invaded, 9 — It is not injurious to potatoes in Colorado at a certain altitude, 10 — New food-plants, 10 — It feeds noon cabbage, 11—Its hibernation, 11—Objections raised against the use of Paris green, 11 - Paris green is an efficient remedy and now in general nse, 12 - Box for dusting Paris green, 12 - Mixing the poison with diluents, 12 - No serious cases of poisoning have come to knowledge, 13 -Aptidote for Paris green, 13 — Other applications, 13 — Messrs. Sannders's and Reed's experiments with various substances, 14 - Experiments with decoctions of various plants, 15 - Air-slacked lime as a remedy, 15 - Mechanical means, 15 - Squire's Brushing machine, 15 - Creighton's

The Colorado Potato-beetle

	TD
Notes of the Year—Continued.	Page
THE COLORADO POTATO-BEETLE.	
Improved Patent Insect Destroyer, 15— Disadvantage of all mechanical means, 16— A simple and effective way of brushing off and killing the bugs, 16— Natural enemies increasing, 16— Chickens acquiring a taste for eggs and larvæ of the beetle, 16—Spiders are among its enemies, 17— The 15-Spotted Ladybird and its larva, 18— The Iey Ladybird, 18— The Ring-banded Soldier-bug, 19— The Dotted-legged Plant-bug, 19— The Spined Soldier-bug and its earlier states, 20— The Nebraska Beekiller, 21—The Kansas Bombardier-beetle, 21—Rove-beetles of the genera Philonthus and Quedius, 21.	22
Time of year that the first moths appear, 22—Time required for devel-	22
opment, 22—Proper time to apply the bandages around the tree, 22—It attacks peaches, 22—Best kind of bandages, 23—Wier's Apple-worm Trap, 23—Advantages and disadvantages of the trap, 24—Overestimating the value of Wier's trap, 25—Jarring, 25—Mr. Chapin's method of knocking down the wormy apples, 26—When this operation should begin, 26—Fires, lights and bottles of liquid not to be recommended as a remedy, 27—Worthlessness of Todd's book "The Apple Culturist," 28—Natural enemies, 28—The Pennsylvania Soldier-beetle and its larva, 28—The Two-lined Soldier-beetle and its larva, 29—Description	
of the larva of Telephorus bilineatus, 30 — Summary, 30.	
THE PERIODICAL CICADA	30
Reproduction, with corrections and additions, of the Chronological table	
of Broods I to VI from Report I, 31.	
THE GRAPE-VINE COLASPIS AGAIN.	34
Redescription of the larva from well-preserved specimens, 34. The Harlequin Cabbage-bug	95
It was not known in Missouri prior to 1870, 35—Its geographical range and color variations, 35—Insect enemies of the cabbage plant, 35—Dr. Lynecenm's account of its habits and injury caused by it in Texas, 36—Its appearance in Missouri in 1870, 36—The egg, 37—The larva and pupa, 37—Several annual broods, 37—The mature bug, 37—In-	35
jury eaused by it, 37 — Its eongener in Europe, 38. The Rascal Leaf-crumpler	38
Its proper scientific name, 38—It is hardly noticed in summer time, 38—Injury caused by it, 39—It hibernates as larva, 39—Habits of the larva, 39—The larval case, 39—Characteristics of the moth, 39—Food plants, 39—Remedics, 40—Natural enemies, 40—LeBaron's description of Tachina phycita, 40—Limneria fugiliva, 41—Description of imago, larva and chrysalis of the Rascal Leaf-crumpler, 41—Description of the variety nebulella, 42.	03
'he Walnut Case-bearer	42
Other ease-bearers enumerated, 42—The case of the Walnut ease-bearer, .42—Differences between the moth and that of the Rascal Leaf-crumpler, 43—Natural enemies, 43—Description of Perilitus indagator, 43.	
The Apple-leaf Skeletonizer	44
Its work on the leaves of Apple trees, 44—The worm and the chrysalis, 44—Appearance of the moth, 45—Mr. Hammond's account of the injury cansed by the worm, 45—The European Acrobasis consociella, 45—Remedies and parasites, 45—Description of imago, larva and pupa, 46.	
The Green Apple Leaf-tyer. It occurs almost always in company with the foregoing, 46—Characters	46
and habits of the worm, 46—The Chrysalis, 47—Description of imago,	

larva and ehrysalis, 47.

The Lesser Apple Leaf-folder	Page.
Its larva and pupa closely resembles those of the foregoing species, 47—	19.6
Mr. Wier's account of its habits, 48 — Remedy, 49.	
The Apple-leaf Bucculatrix	49
It is not very injurions in Missouri, 49 — Account of damage cansed by it	70
in New York, 50 — The worm and its habits, 50 — Its transformations,	
50 — Season of the appearance of the moth, 50 — Remedies, 50 — Hab-	
its of Bucculatrix thuiella, 51—Description of larva and pupa of the	
Apple-Jeaf Bucculatrix, 51.	
The Apple-twig Borer	51
Its frequent occurrence in Missouri, 51—Characters of the beetle, 52—	0.1
The holes made by it in the twigs, 52—The holes are made only for	
food and protection, 52 — The insect breeds probably in the sap-wood of	
forest trees, 52—The larva of Sinoxylon bassillare mistaken for that of	
the Apple-twig Borer, 52—Remedy, 53.	
Insects injurious to the Grape-vine	53
THE RED-SHOULDERED SINOXYLON.	53
Characteristics of the insect as imago, larva and pupa, 54 — Damage done	00
by it to grape-vines, fruit trees and Hickory, 54—Description of the	
larva and pupa, 54.	
Grape Disease	55
THE GRAPE-LEAF GALL-LOUSE	55
Its scientific name, 55—The law of priority, 55—European grape-vines	00
valueless in the eastern U. S., 55 — Deterioration of some of our native	
vines, 56—Climatic reasons for the failure of European vines, 56—	
The principal cause of this failure is the Phylloxera, 56—Further	
proof of the identity of the American with the European insect, 57—	
Reasons for the identity of the Gall-louse with the Root-louse, 57—	
Further facts respecting the habits of the Root-louse, 58—Underground	
forms, 58—The young lice and their habits, 59—Hibernation, 59—	
, , , , , , , , , , , , , , , , , , , ,	
The pupa, 59—The winged female, 59—Susceptibility of different vines to the attacks of the louse, 60—Classification of the North Amer-	
·	
ican grape-vines according to their practical importance, 60 — Synop-	
sis of the True Grape-vines of the U. S., by Dr. George Engelmann,	
60—Difficulty of separating the cultivated varieties of grape-vine,	
61 — Importance of a proper classification of cultivated grape-vines,	
62—Importation into Enrope of resisting American vines, 62—Enum-	
eration of the cultivated varieties and their susceptibility to the dis-	
ease, 63—No variety is entirely exempt from the attacks of the root-	
louse, 64—American vines which resisted the root-louse in Europe,	
64 — Means of contagion from one vine to another, 64 — The spread of	
the root-lice from one vine to another, 64 — Transportation of the louse	
upon the roots of scedlings and cuttings, 64—Spread of the disease in	
France, 64—The winged female of the root-lonse and her function,	
65—The vernal leaf-gall, 65—Preference of the winged Phylloxera for	
the Clinton grape and its allies, 65—Power of flight of Phylloxera ca	
ryæfoliæ, 66 — Deposition of the eggs upon the leaf, 66 — Probable rea-	
sons why the injuries of the Phylloxera are greater in Europe than in	
America, 66—Outward and more visible effects of the root-disease,	
67—Practical suggestions, 67—No need to destroy the Clinton vines,	
67—Influence of soil on the intensity of the disease, 67—Remedies,	
68 — Destruction of the gall-lice, 68 — Destruction of the root-lice, 68 —	

Results of experiments in France with various substances, 68—firigation and submersion, 69—Résumé of the insect's history, 69—No need

of unnecessary alarm, 70.

BENEFICIAL INSECTS.

Page.

iikworms	12
Introductory	72
The Morus multicaulis fever and its reaction, 72—Increasing attention	
lately given to silk-culture in America, 72 — North America well adapted	
to the raising of silk, 73—General outlines of the natural history of	
the eight species of Silkworms treated of in this Report, 74.	
THE MULBERRY SILKWORM	75
Its past history, 75— Earliest silk-culture in China and India, 75—Its	
introduction into Europe, 76— Value of silk produced in France, 76—	
The "Silk Supply Association" in England and its objects, 76—	
Countries exporting raw silk, 77 — The name given to silk by different	
nations, 77 — History of the Mulberry Silkworm in America, 77 — Its	
introduction and failure of earlier efforts, 77 — Renewal of silk-culture	
within the past decade, 77—Silk manufacture in the United States,	
78—Favorable prospects for raising silk in this country, 78—Silk-	
growing in California, 79—Mr. Prevost's "California Silk-grower's	
Manual," 79—False statements and exaggerations in Prevost's book,	
79—Sale of Californian Silkworm eggs, 80—Disastrons effect of the	
Franco-Prussian war on the egg trade, 81 — Success of silk-culture in	
California dependent on the ability to reel the silk, 81 — Silk-culture in	
Kansas, 82—Mons. Boissière's silk establishment and its chances of	
success, 82 — Silk-growing in Missouri, 83 — The fall season in Missouri	
eminently propitious for rearing silkworms, 84 — Natural history of the	
Silkworm, 84 — Races of the Silkworm produced by domestication, 84 —	
Effects produced on the insect by domestication, 85—The egg, 86—	
Larva and larval changes, 86 — Cocoon, chrysalis and moth, 87 — No	
insect parasite of the silkworm in Europe, 87—The "Uji" disease in	
China and Japan, 87 — Diseases of the Silkworm, 88; The Muscardine,	
its effect and cause, 88; The Pébrine disease, its symptoms and cause,	
89; Nature and origin of these diseases, 90—Other diseases of the	
Silkworm, 91 — Best varieties or races, 90 — Different forms of cocoons	
produced by different races, 92—How best to rear silkworms, 92—	
Rearing a very simple process, 92—Character of climate of the Japanese	
silk districts, 93 — Keeping the eggs during the winter, 93 — Hatching	
of the eggs, 93 — Room and building for the rearing of the worms, 93 —	
The feeding net or fillet, 94 — Importance of carrying all the worms	
simultaneously through their moults, 94 - Regularity of feeding, 95 -	
Regulating the temperature, 95 — Cocoonery, 96 — Choking the chrysa-	
lis, 96 — Egg-laying, 97 — Selecting and fastening the cocoons for breed-	
ing purposes, 97 — Treatment of the female moths after copulation, 97 —	
Preservation of the eggs, 97 — Reeling, 98 — Great skill required to ac-	
complish the work properly, 98—Classification of raw silk, 98—Pre-	
paring the cocoons for reeling, 98—Objects of and manipulations in	
reeling, 99—Best food for the worms, 100—Varieties of the Mulberry,	
. 100—Cultivation of the Mulberry, 100—Osage Orange as silkworm	
food, 100—Introduction of the Osage Orange into France, 100—Ex-	
periments in America with feeding silkworms on Osage Orange, 101 —	
Advantages and disadvantages of the Osage Orange, 102.	
THE CECEODIA SHEWADA	109

Changes made in its scientific generic name, 103—General appearance of the moth, 103—Fitch's explanation of the specific name, 104—Food plants, 104—The cocoon, 104—Value of its cocoon as compared with that of the Polyphemus moth, 105—How the moth issues from the co-

112

121

123

125

130

137

		0		- 1
Sill	eworm	8—C	ontiu	med.

THE CECROPIA SILKWORM.

coon, 105—The moth immediately after hatching, 106—The egg, 106—Description of the larval changes, 106—Strange habit of birds of using the empty cocoon as a storchouse, 107—The Cecropia worm cannot be classed as an injurious insect, 107—Samia columbia ought to be considered a variety of cecropia, 107—Parasites, 107—The Long-tailed Ophion, 107; its mode of oviposition, 108; habits of its larva, 108—The Cecropia Tachina-fly, 108; how it affects its victim, 108; its larva and imago, 109—The Mary Chalcis-fly, 109; how it escapes from the cocoon of the moth, 109; description of the imago, 110—The Cecropia Cryptus, 110; its habits, 110; description of the two sexes, 111; how it differs from the allied species, 111.

- The Alianthus Silkworm.

 Difference between the silkworms of the Castor-bean and Ailanthus, 112 —
 Introduction of the Ailanthus silkworm into Europe, 113 Ailanthienltnre in Europe, 113 Its introduction into America, 114 Disadvantages
 of the Ailanthus silkworm, 115 Its acclimatization in America and Australia, 115 Value of the cocoon, 115 Mr. Forgemol's device for unwinding the cocoon, 116 Natural history of the Ailanthus silkworm,
 117 The egg and mode of egg-laying, 117 Larval changes, 117 —
 Pupation, 118 The imago and its variations, 118 Food plants, 118 —
 Directions for raising the worms, 119 A good word for the Ailanthus
 tree, 120.
- The Luna Silkworm

 The beantiful appearance of the moth, 123—The cocoon, 124—Foodplants, 124—Larval changes, 124—Season when the imago issues, 125—No parasites of the worm known, 125—Actias selene probably identical with luna, 125.
- The Polyphemus Silkworm

 Mode of egg-laying, 125—The egg, 126—Food-plants, 126—Larval changes, 126—The eccoon, 126—Mr. Trouvelot's account of the issuing of the moth, 127—Wonderful vitality of the chrysalis, 127—Characters of the moth and its variations, 128—The broad antennæ of the male moth mistaken for a third pair of wings, 128—Difficulty of reeling the eccoon, 129—Number of annual broads, 129—Parasites, 129.
- The Yama-Maï Silkworm.

 Its native home and food-plant, 130—Its introduction into Europe and Australia, 130—Attempts at raising it in America, 130—The egg and how it should be kept over winter, 131—Climate most favorable for the worm, 131—The worm and its resemblance to the leaf, 132—Food plants, 132—Larval changes, 132—The cocoon and the value of its silk, 133—The moth and its habits, 133—Difficulties of rearing the worm, 133—Mr. Adams's account of rearing the Yama-maï Worm in Japan, 134 The Uji parasite, 136.
- THE PERNY SILKWORM...

 Its native home, 137—How it differs from the preceding, 137—Larval changes, 137—The cocoon and its silk, 137—The moth, 137—Its culture in China, 138—The Tusseh Silkworm, 138.

NOXIOUS INSECTS.

Notes of the NY	Page.
Notes of the Year	46
THE CODLING MOTH. Experiments with Wier's Apple-worm trap, 46 — Value of different mate-	46
rials for bandages, 47 — Jarring, 48 — Occurrence of the Apple-worm in	
California, 49 — Enemies and parasites, 44 — The Ring-legged Pimpla,	
49—The Delicate Long-sting, 50—Other enemies, 51—Efficiency of	
the Spined Soldier-bng, 51—False doctrines for exterminating the Cod-	
ling Moth, 51.	
TRE COLORADO POTATO-BEETLE	52
Its comparative harmlessness in 1872, 52—New food-plants, 52—Its pro-	32
gress eastward up to 1872, 52 — Experiments with Paris green, 53 — New	
enemies, 53 — The Rust-red Social Wasp, 54 — The Rose-breasted Gros-	
beek, 54.	
THE APPLE-TWIG BORER	54
It attacks also pear twigs, 54—It has been bred from grape-canes by Dr.	0.4
Shimer, 54.	
Egg of the Horned Passalus	55
The egg, 55 — The newly hatched larva, 55 — Rapid development of the	
insect, 55.	
EGG OF THE COMMON MAY BEETLE	55
Description of the eggs and how they are deposited, 55.	
Egg of the Broad-necked Prionus	56
Characteristics of the eggs and where they are deposited, 56.	
EGGS OF AMERICAN TENT-CATERPILLAR	56
Correction of the figure given in Report III of the egg-belt, 56.	
COUNTERWORKING THE TOBACCO WORM	56
Mr. White's method of planting the Jamestown Weed among the potatoes	
and poisoning the blossoms thereof, 56.	
The Grape Phylloxera	57
Its popular name, 57 — Accounts of the nunsnal mortality among grape-	
vines in the spring of 1872, 57—Canses of this mortality given in the	
accounts, 59 — Excessive drouth and overbearing, 60 — The Phylloxera	
is the true canse, 60—Actual proof of the Phylloxera having cansed	
the mortality among grape-vines, 61 — Influences that favored the in-	
crease of the lice in 1872, 61—Importance of a full understanding and	
management of the Phylloxera, 62—Its range in North America, 62—	
Its spread in Europe, 63—Inconstancy in the habits of the gall-lice,	
63—The leaves of Clinton vine no longer affected by the gall-lie since	
1871, 63 — Method of formation of the leaf-gall, 64 — Relative immunity	
of American vines in Europe, 64 — Propagating American varieties from	
cuttings, 65 — Appreciation of American vines in Europe, 66 — Careless	
statement published as to the immunity of Labrusca-vine, 66 — Grafting	
the grape-vine, 67—New theories, 67—The Phylloxera is the true cause	
and not the effect of the disease, 67 — Mr. Laliman's theory that the in-	
seet has always existed in Europe, 68—Oidium Tuckeri of Europe and	
America identical, 69 — Mr. Saunders's account of the presence of <i>Oidium Tuckeri</i> in America, 70 — Means of contagion of the disease from one vine	
to another, 69—Flying capacity of the winged Phylloxera, 70—The	
male lonse, 71—Remedies, 71—Efficacy of earbolic acid and soot,	
71 — Value of submersion or irrigation, 72 — Sprinkling with quick-lime,	
ashes, etc., 72—Mr. Lichtenstein's experiments to allure the lice, 72—	
Experiments with earbolic acid, 73.	

	Page.
The Oyster-shell Bark-louse of the Apple. Its occurrence in Missouri, 74—Its appearance in Luray County, Missouri, 74—Mr. Hanau's account of its spread, 75—Its occurrence in Sonthern	73
Missouri, 76—Its occurrence in Mississippi and Georgia, 78—Its appearance in Kansas, 79—It is double-brooded in the South, 79—The waxy secretion of Homoptera, 80—The newly hatched louse, 80—The larval scale, 81—Development of the female scale, 81—Growth of the	
male scale, 82—The male louse, 83—Rare occurrence of the winged male, 84—Agamie multiplication, 85,—Mode of spreading, 85—Foodplants, 86—Varieties of the Apple tree preferred by it, 86—Enemies and parasites, 87; Mites, 87; Aphelinus mytilaspidis and Dr. Le Baron's account of its habits, 88—Easy transportation and introduction of the Aphelinus, 90—Remedies, 90—Application of oily substances, 90—Bibliographical and Descriptive, 91—The generic name, 91—Signoret's classification of the Coccide, 92—Specific name, 92—Characteristies and habits of three allied species, 93—A new name necessary for our apple-tree species, 94—Description of the eggs and the winged male, 95; of the male and female scale and of the female louse, 96.	
The Pine-leaf Scale-insect	97
The Hickory Bark-borer Accounts of the damage eansed by it in Missouri, 103 — Habits of the Enropean Scolytus destructor, 104 — Various kinds of Hickory attacked by the Hickory Bark-borer, 105 — Its natural history, 105 — Natural enemies, 106 — Descriptions of the Three-banded Spathins, 106 — Mr. Cresson's description of Bracon scolytivorus, 106 — Remedies, 107 — Description of the imago, 107 — Is it different from Scolytus 4-spinosus? 107.	103
The Rose Chafer	108
The False Chinch-bug. It was not known as injurious before 1872, 111—Accounts of injury done by it, 111—How it differs from the true Chinch-bug, 112—Its probable natural history, 112—Description of imago, larva, and pupa, 113—Variation in the imago, 113—Its great abundance in the Fall of 1872, 114.	111
Insects injurious to the Grape-vine	114
THE GRAPE-VINE APPLE-GALL. The breast bone of Gall-gnat larvæ, 114 — The gall mistaken for an apple, 114 — Form of the gall, 115 — Habits of the larva, 116.	114
THE GRAPE-VINE FILBERT-GALL. Appearance of the gall, 116—Larva of the gall-maker, 117.	116
THE GRAPE-VINE TOMATO-GALL. Its eurious resemblance to a tomato, 117 — Various shapes assumed by it, 118 — The larva, 118 — Enemics of the larva, 118.	117
THE GRAPE-LEAF TRUMPET-GALL. Characteristics and occurrence of the gall, 118.	118

Eggs in and on canes and twigs. Probable eggs of the Jumping Tree-cricket, 119—The egg-punetures on grape-cane, 119—Characters of the egg, 119—General appearance of the cricket, 120.	119
Eggs of the Snowy Tree-cricket, 120.—Trees and shrubs attacked by this cricket, 120.—The egg, 120.—Habits and natural history, 120.—Injury done by it, 121.—The eggs mistaken by Fitch for those of the Buffalo Tree-hopper, 121.	
Egg-punctures of the Buffalo Tree-hopper, 122—Development of the larva, 121—Characters and habits of the perfect insect, 122—Egg-punctures of some unknown Tree-hopper, 122.	
Egg-punctures of the Frosted Lightning-hopper, 122—Development and habits of the insect, 122. Egg-punctures probably of Orchelimum glaberimum, 123—The egg, 123—	
Characters and habits of the imago, 123. Eggs of the Oblong-winged Katydid, 123—They have been mistaken by Harris for those of the Broad-winged Katydid, 123—Ovipositors and	
modes of egg-laying in the three Katydids occurring in Missouri, 124 — Increase in thickness of Katydid eggs before hatching, 124.	
Stinging larvæ. The Potato-worm falsely considered as a stinging caterpillar, 125 — General harmlessness to man of insect larvæ, 125 — Stinging eaterpillars in Europe and North America, 126 — List of such larvæ in U. S., 126 — De-	125
scription of larva and chrysalis of Aeronycta xylinoides, 126.	
THE BUCK MOTH OR MAIA MOTH. Flight and characteristics of the moth, 127—The egg and mode of egglaying, 128—Appearance of the full-grown larva, 129—Larval changes, 129—Color variations of the larva, 130—Habits of the young larva, 130—The sting of the larva, 131—The pupa, 131—Issuing of the moth, 132—Irregularity and retardation in development, 132; the species benefits thereby, 132—Food plants, 132—Natural enemies, 132.	127
The Io Moth The male and female moth, 133—The egg, 134—The larva and its urtieating power, 134—Larval changes, 135—Pupation, 135—Food plants, 136—Parasites, 136.	133
The Green-striped Maple-worm. Account of its occurrence in great numbers in Kansas, 137—Injury done by it to Soft maples, 138—The egg, 138—Larval changes, 138—The chrysalis, 139—The imago, 139—Natural enemies, 139—Description of Belvoisia bifasciata, 140—Remedies, 141.	137
INNOXIOUS INSECTS.	
The Hellgrammite Fly. The eggs, 143—Respiratory apparatus of the larva, 143—Habits of the larva when about to transform, 143—The pupa, 144—Sexual difference in the imago, 145.	143
The Goat-weed Butterfly The egg, 146—Habits of the larva, 146—Larval changes, 146—Transformation, 147—New food-plant, 147—Simulation of the color of the food-plant by the larva, 147—Two annual broods, 148—Hibernation of the imago, 148—Natural enemies, 149.	145

Page. On a new genus in the Lepidopterous Family Tineidæ with remarks on the fertilization of Yucca 150 Generic characters of Pronuba, 150 — Description of Pronuba vuccasella, 151 — Plants requiring the aid of insects for fertilization, 152 — Fertilization of Orchids, 152 — Fructification of Yucca, 153 — Yuccas must rely on insects for fertilization, 153-Insects frequenting Yuccas, 154-Diurnal and nocturnal habits of Pronnba, 154 — How the female moth fertilizes the plant, 154 - Oviposition, 155 - The larva within the young frnit, 155 — Description of the larva, 155 — Only a small percentage of fruit not infested by the larva, 156 - The larva leaves the eapsule and enters the ground for hibernation, 156 - Mntual adaptation of plant and insect, 156 - The moth doubtless occurs wherever Yuccas grow wild, 157 - Easy transportation of the cocoon, 158 - Further facts regarding the fructification of Tucca filamentosa and gloriosa, 158— Yuccas seeding in Europe, 159 — Range of the insect, 159 — Mr. Stainton's opinion on the characters of the Yucca moth, 160. REPORT VI. [Submitted December 2, 1873; published March, 1874.] Table of Contents.... 3 6 NOXIOUS INSECTS. Notes of the Year 9 THE CODLING MOTH..... Failure of the apple crop in 1873, 9—Dr. LeBaron's observations on the habits of the worm, 9-Proportion of worms leaving the fruit before it falls, 10 - How it affects pears, 10 - Time and method of using bandages, 10 - Westward spread of the insect, 10. The Colorado Potato-beetle 11 How it has affected the price of potatoes, 11 — New food-plants, 11 — Its progress eastward during 1873, 12 - Improved methods of using Paris green, 13 - Device for jarring off the bugs, 14 - European publications on the insect, 15 - Danger of its introduction into Europe, 15 - Precautionary measures to be taken in Europe, 16. THE COTTON WORM..... 17 Paris green suggested as remedy, 17 — Address before the National Agricultural Congress, 17 — Mr. Glover's summary on experience with Paris green, 19 - Experiments with the poison, 19 - Johnson's Sprinkling machine, 20 — Patents on Paris green, 20 — The Royall mixture, 21 — Hibernation of the insect, 22 - Natural enemies, 23 - Geographical range, 23 — Position of the moth when alighting, 24. THE CANKER WORM. 24 Dr. LeBaron's summary of remedies, 24 - Mr. Milliken's experience with the rope and tin trap, 25 — The Paris green remedy, 26 — A new trough, 26 — Birds which destroy the worm, 27 - Mr. Mann's observations on the insect, 28 — Two species have hitherto been confounded, 28 — The English Sparrow and the increase of the White-marked Tussock-moth, 29. Insects injurious to the Grape-vine..... 30 THE GRAPE PHYLLOXERA..... 30 The term "Phylloxera", 30 — Bibliographical history, 30 — Characters of the genus and its position in the system, 33 — Biological history, 33 —

Different forms which the insect assumes, 33—The gall-inhabiting form, 34—The root-inhabiting form, 38—Balbiani's discovery of the

Page.

Insects injurious to the Grape-vine-Continued.

THE GRAPE PHYLLOXERA.

true sexual individuals and the winter egg of Phylloxera quercus, 41 — The winter egg not essential to the winter life of the Grape Phylloxera, 42 - Polymorphism in Phylloxera, 43 - Conclusive proof of the identity of the root- and gall-lice, 44 - Practical considerations, 44 - The more manifest and external effects of the disease, 44 — Mode of spreading, 45 - Swarming of winged specimens of Phylloxera caryafolia, 45 -Power of flight in the Grape Phylloxera, 45 - Spread of the disease through the winged females, 46-Susceptibility of different vines to the disease, 46—Practical importance of knowing the more resisting and more susceptible vines, 46 - List of the cultivated species and varieties of vines indicating their relative susceptibility to Phylloxera, 47 - Prophylactic means of coping with the disease, 48 - Grafting the more susceptible onto the roots of resisting vines, 48 — Other preventive measures, 50 - Natural enemies, 50 - Insect enemies of the gall-lonse, 50 — Enemies of the root-louse, 52 — The Phylloxera mite, 52 — Different forms assumed by mites in their development, 52 - Hoplophora arctata, 53 — Peculiarities of the Oribatida, 54 — Direct remedies, 55 — Submersion a perfect remedy, 55 - Application of pure insecticides without satisfactory results, 56-Range of the insect in America, 57-Injury caused by it in America, 58 — Reasons why the insect is more injurious in Enrope, 59 — False theories, 60 — The Phylloxera is the cause and not the effect of the disease, 60 - It is a native American insect and has been imported into Europe, 62-It is peculiar to the Grape-vine, 63-The American Oak Phylloxera and its natural history, 64 — Conclusion, 65.

Appendix and Notes to the Article on Grape Phylloxera.....

66

Diagnosis of Phylloxera vastatrix, 66 — Influence of the insect's princture. 67 — The supposed male of the gall-lonse, 67 — The non-cultivation of the Clinton grape, 67 — Transient nature of the leaf-galls, 68 — Constancy of the differences between the forms assumed by the insect, 68 -Supposed sexual individuals, 68 - Number of generations annually produced, 69 - Number of molts, 69 - Transplanting root-lice on to the leaves, 69 - Nature of the swelling on the roots produced by Phylloxera. 70 — The true Grape-vines of the United States, by Dr. G. Engelmann, 70 - Exceptional instances where the European Vine has succeeded in America, 76 - Grafting the more susceptible onto the roots of the resisting varieties, 78 - Descriptions of Tyroglyphus phylloxera and Hoplophora arctata, 81 - Efficacy of inundating the vineyards, 82 - Facts showing that the disease of Grape-vines in America is principally caused by Phylloxera, 82 - Description of Phylloxera rileyi, 86 - The true sexual individuals and the winter egg, 86.

THE BLUE CATERPILLARS OF THE VINE.....

87

- 1. The Grape-vine Epimenis, 87 Habits and characters of the larva, 87 — Description of larva and chrysalis, 88.
- 2. The Beautiful Wood Nymph, 88 Characters and food plants of the larva, 88 — The moth and the egg, 89 — Description of the egg and larva, 89 — Of the chrysalis, 90.
- 3. The Pearl Wood Nymph, 90—Its larva almost undistinguishable from that of the foregoing species, 90 - Food-plant, 91 - Distinguishing characters of the moth, 91 - Mr. Lintner's description of the larva, 92 - Mr. Lintner on the difference between the larva of Eudryas grata and E.
- 4. The Eight-spotted Forester, 94 Description of the larva, 94; Chrysalis and imago, 95.

The Bou's Caterrileans of the larve of these four species, 95—Remedies, 96. The Red-legged Ham-beetle		Page.
Summary, 95—Comparison of the larvæ of these four species, 95—Remedios, 96. The Red-legged Ham-beetle	Insects injurious to the Grape-vine—Continued.	
Remedies, 96. The Red-legged Ham-beetle Its popular name, 96—It has been the cause of an interesting law-suit, 96; Entomological information necessary to a just verdiet, 98—Another ease before a jury requiring botanical knowledge, 98—Injury caused by the beetle in St. Louis, 99—The eggs, and how they are deposited, 99—The larva and its habits, 99—The pupa, 99—Prevention, 100—Other species as ossociated with it, 100—Habits of other species of Cteridae, 101—How Meerobia raficollis saved the life of Latreille, 101—Description of the larva of Corynetes rafipes, 101—Description of the pupa, 102. The Clover-hay Worm. Its geographical distribution, 102—It has probably been imported from Europe, 101—Its past history and accounts of damage caused by it, 102—Its natural history, 105—Remedies, 105—Description of larva and chrysalis, 103; of the imago, 107—Its allied congener, Asopia olinalis, 107. The Legged Maple Borer The burrows of the larva, 108—Appearance of the moth, 103—Remarks on the nomenelature of the species, 103—Injury caused by it to maples, 109—It attacks only trees already injured by some cause or another, 109—Remedies, 110—Description of imago, larva and pupa, 110. The Raspberry Root-borer Work of Oberca perspicillata in cances of Raspberry and Blackberry, 111—Injury caused by the Root-borer, 111—General appearance and habits of the worm, 112—Description of imago and larva, 113. The Northern Brenthian Its occurrence and distribution, 113—Characteristics of the beetle, 114—Fighting habits of the males, 114—How the male assists the female in ovipositing, 115—How much time is required for the transformations of the insect, 115—Habits of the larva, 115—Description of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionide, 118. The Jumping Sumach-beetle Sumach industry in Europe and America, 118—Species of sumach possessing economic value,		
The Red-legged Ham-beetle		
Its popular name, 96—It has been the eause of an interesting law-suit, 96; Entomological information necessary to a just verdiet, 98—Another ease before a jury requiring botanical knowledge, 98—Injury eaused by the beetle in St. Louis, 99—The eggs, and how they are deposited, 99—The larva and its habits, 99—The pupa, 99—Prevention, 100—Other species associated with it, 100—Habits of other species of Cleridae, 101—How Mecrobia ruficollis saved the life of Latreille, 101—Description of the larva of Corpuctes rufipes, 101—Description of the pupa, 102. The Clover-hay Worm		96
96; Entomological information necessary to a just verdict, 98—Another ease before a jury requiring botanical knowledge, 98—Injury eaused by the beetle in St. Louis, 99—The eggs, and how they are deposited, 99—The larva and its habits, 99—The pupa, 99—Prevention, 100—Other species associated with it, 100—Habits of other species of Cleridae, 101—How Mecrobia ruficolitis saved the life of Latreille, 101—Description of the larva of Corynetes rufipes, 101—Description of the pupa, 102. The Northern Brenthian		
Its occurrence and distribution, 113—Characteristics of the beetle, 114— Fighting habits of the males, 114—How the male assists the female in ovipositing, 115—How much time is required for the transformations of the insect, 115—Habits of the larva, 115—Description of the larva, 115; of the pupa, 116—Real position of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionide, 118. The Jumping Sumach-beetle Sumach industry in Europe and America, 118—Species of sumach possessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumachs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite Other enemics of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		
Fighting habits of the males, 114—How the male assists the female in ovipositing, 115—How much time is required for the transformations of the insect, 115—Habits of the larva, 115—Description of the larva, 115; of the pupa, 116—Real position of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionidæ, 118. The Jumping Sumach-beetle Sumach industry in Europe and America, 118—Species of sumach possessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumachs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite Other enemies of the White Grub Parasite Other enemies of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		
ovipositing, 115—How much time is required for the transformations of the insect, 115—Habits of the larva, 115—Description of the larva, 115; of the pupa, 116—Real position of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionidæ, 118. The Jumping Sumach-beetle Sumach industry in Europe and America, 118—Species of sumach possessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumachs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite Other enemies of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		
the insect, 115—Habits of the larva, 115—Description of the larva, 115; of the pupa, 116—Real position of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionidæ, 118. The Jumping Sumach-beetle		
115; of the pupa, 116—Real position of the Brenthians in the system, 116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionidæ, 118. The Jumping Sumach-beetle		
116—The specific and generic names, 116—How another larva has been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionide, 118. The Jumping Sumach-beetle		
been mistaken for that of the Northern Brenthian, 117—Description of this larva, which evidently belongs to the Tenebrionide, 118. The Jumping Sumach-beetle		
this larva, which evidently belongs to the Tenebrionide, 118. The Jumping Sumach-beetle		
The Jumping Sumach-beetle Sumach industry in Europe and America, 118—Species of sumach possessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumachs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite. Other enemies of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		
Sumaeh industry in Europe and America, 118—Species of sumaeh possessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumaehs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite. Other enemies of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		118
sessing economic value, 119—Appearance and habits of the beetle, 119—The egg-masses, 120—Development and habits of the larva, 120—Transformation, 120—The two annual broods, 120—Injury caused by it to the sumachs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite. Other enemies of the White Grub, 123—Cocoon and larva of Tiphia, 123—It is undoubtedly a parasite of the White Grub, 124—Characters of the genus Tiphia, 124—Habits of Tiphia femorata, 124—Habits of the Tiphia larva, 124—Characters of the Unadorned Tiphia, 125—Beetle parasitic upon it, 125—Description of larva and imago, 126—The		
120 — Transformation, 120 — The two annual broods, 120 — Injury eaused by it to the sumaehs, 121 — Geographical range, 121 — Remedies, 121 — Description of larva and pupa, 121 — Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite. 123 Other enemies of the White Grub, 123 — Cocoon and larva of Tiphia, 123 — It is undoubtedly a parasite of the White Grub, 124 — Characters of the genus Tiphia, 124 — Habits of Tiphia femorata, 124 — Habits of the Tiphia larva, 124 — Characters of the Unadorned Tiphia, 125 — Beetle parasitie upon it, 125 — Description of larva and imago, 126 — The		
by it to the sumaehs, 121—Geographical range, 121—Remedies, 121—Description of larva and pupa, 121—Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite		
Description of larva and pupa, 121 — Variations of the beetle, 122. BENEFICIAL INSECTS. The Unadorned Tiphia or White Grub Parasite. Other enemies of the White Grub, 123 — Coeoon and larva of Tiphia, 123 — It is undoubtedly a parasite of the White Grub, 124 — Charaeters of the genus Tiphia, 124 — Habits of Tiphia femorata, 124 — Habits of the Tiphia larva, 124 — Charaeters of the Unadorned Tiphia, 125 — Beetle parasitie upon it, 125 — Description of larva and imago, 126 — The	,

parasitie upon it, 125 — Description of larva and imago, 126 — The		
species has been described under three different frames, 120.	species has been described under three different names, 126.	

INNOXIOUS INSECTS.

	rage.
The Dominican Case-bearer	127
Characters of the beetle, 127 — Mode of oviposition, 128 — Oviposition of Chlamys plicata, 128 — The young larva and its food habits, 129 — The case of the larva, 129 — Characters of the larva, 130 — Time required in the characters of the larva, 120 — Time required	
for its development, 130. The Yucca Moth	131
Its natural history completed, 131—Description of the chrysalis, 131— Hatching of the chrysalis, 132—Method of oviposition, 133—Oviposition is followed by pollination, 134—The egg in the young fruit and the embryo larva, 134—It is the only insect that can well fertilize the Yuccas, 135.	101
Hackberry Butterflies	136
The European Purple Emperor, 136 — Insufficient former account of their earlier states, 136 — Species of Celtis in Missouri, 137.	200
THE EYED EMPEROR.	137
The full-grown larva, 137 — Habits of the larva, 138 — Pupation, 138 — The imago, 139 — The egg and the young larva, 139 — Two annual broods, 139 — Hibernation of the young larva, 140.	
THE TAWNY EMPEROR. How it differs from the Eyed Emperor, 140—The egg, 141—Larval changes and habits, 141—Egg parasite, 142.	140
BIBLIOGRAPHICAL	142
The generic name, 142—The specific names of the two species, 143—Fabricius's original description of Lycaon and Herse, 144—Other species of the genus in the United States, 145—On the validity of Alicia, 145—Descriptions of the earlier states of both species, 146—Their popular names, 148—The scientific specific names, 149.	
Katydids	150
General considerations, 150 — Spring in Europe and America, 151 — Stridulating noise produced by crickets and grasshoppers, 152 — Sounds inaudible to man, 152 — Grasshoppers, Katydids, Locusts, 153 — Habits and general appearance of our Katydids, 154 — They oviposit above ground, 154, — Their ovipositors not rudimental, 155.	
The Angular-Winged Katydid It is the most common species in Missonri, 155 — General character of the insect, 155 — The eggs, 155 — Erroneons statement concerning the egg, 156 — How the female deposits the eggs, 156 — Number of eggs laid by the female, 158 — Hatching of the larva, 158 — Food of the larva, 158 — Changing from the pupa to the perfect state, 159 — Its song, 159 — It is capable of domestication to a certain degree, 160 — Description of the immature states, 161 — Natural enemies, 162 — The Back-rolling Wonder, an egg-parasite, 162 — Curious habit of the female Antigaster, 162 — Description of Antigaster mirabilis, 163 — Striking sexual differences, 163.	155
THE NARROW-WINGED KATYDID	164
Distinguishing characters, 164—Method of oviposition, 165—The egg, 165—Its song, 166—Description of larva and pupa, 166.	
THE BROAD-WINGED KATYDID.	167
It is the true Katydid, 167—Distinguishing characters, 167—Mode of oviposition as observed in confinement, 167—Mr. Jaeger's erroneous statement regarding the oviposition, 168—Its song, 168.	
THE OBLONG-WINGED KATYDID	169
It has not yet been found in Missouri, 169—Distinguishing characters,	

79.

REPORT VII

REIORI VII.	Domo
[Submitted at time of publication, April, 1875.]	Page.
Preface	III
Table of Contents	VII
NOXIOUS INSECTS.	
The Colorado Potato-beetle	1
Its gradual spread eastward, 1—It reached the Atlantic during the year 1874, 1—Injuries done during the year 1874, 2—Alarm about it in	
Europe, 3 — Prohibiting the importation of American potatoes by Euro-	
pean governments, 3—The insect probably introduced into Europe in the perfect form, 3—It would doubtless thrive in Europe if im-	
ported, 4—Its ravages exaggerated and underrated, 5—On the safety	
and advisability of the use of Paris green, 8-Past experience with	
the poison, 10 - Influence of Paris green on the plant and on the soil,	
11—Influence of the green on man indirectly through the soil or	
through the plant, 13—The beetle eats as well as the larva, 14—It	
passes the winter as imago, 14—New food-plants, 14—New means of destruction, 15—The Gray Sprinkler, 15—The proper scientific name	
of the beetle, 16—Mr. Carrière's ridiculous statements, 17.	
The Chinch Bug	19
Its disastrous work in 1874. 19 — Circular distributed among farmers, 19 —	
Appearance and transformations of the Chiuch Bug, 20—The short-	
winged form, 20 — Description of the Chinch Bug and its earlier states, 21 — Its past history in America, 22 — Its past history in Missouri, 22 —	
Destructive powers of the Chinch Bug, 24—Its injuries in 1874, 24—	
Its injuries in Missouri in 1874, 25 — Food-plants, 26 — Time required	
for the complete development of various insects, 27 - Number of an-	
nnal broods, 27 — Its rapid increase, 28 — Where the eggs are laid, 23 —	
Flight of the Chinch Bug, 29—Its migrations on foot, 30—Heavy	
rains destructive to it, 30—Direct remedies, 31—Irrigation, 31—Pre-	
ventive measures, 32—Burning, 32—Rolling, 33—Manuring and early sowing, 34—Mixing seed, 34—Preventing the migration of the bugs	
from one field to another, 35—Importance of winter work and com-	
bined action, 36—Other possible remedies, 37—Abstaining from the	
enltivation of grains, 38—Natural enemies, 38; Ladybirds, 39; Lace-	
wing fly and habits of its larva, 40; The Insidious Flower-bug and	
the Many-banded Robber, 41 — Birds destructive to the Chinch Bug, 41 —	
Discussion of other proposed remedies and preventive measures, 41-	
The Chinch Bug injurious to stock, 43—Prognosticating, 44—Unnecess	
sary fears, 44 — Bogus Chinch Bugs, 45 — The False Chinch Bug, 46 —	
The Insidious Flower-bug and the Ash-gray Leaf-bug, 47—The Flea-like Negro-bug, 48—Recapitulation, 49.	
APPENDIX TO THE ARTICLE ON THE CHINCH BUG	51
List of correspondents who replied to the circular, 51—Questions an-	
swered by correspondents, 52—Answers given by correspondents, 53.	
The Flat-headed Apple-tree Borer	71
Extent of its ravages in fruit and shade trees, 71 — Its natural history,	
72—Natural enemies, 73—Chalcid larva, 74—The Cherished Bracon,	
75—The Useful Labena, 75—Ants, 76—Remedies, 76—Keeping young	
trees vigorous and healthy, 77 — Coating the trunks and larger branches with soap and other greasy substances, 77 — Scraping, 78 — Wrapping	,
with soap and other greasy substances, 77—scraping, 76—wrapping wire ganze around the trunk, 79—Cutting out the newly-hatched larva,	

Canker Worms	Pa ge. 80
Confusion regarding the two species of Canker Worms, 80—Distinguishing characters of the Spring Canker-worm, 80—Description of egg, larva and chrysalis of Anisopteryx veruata, 82—How the Fall Canker-worm differs from the preceding, 83—Description of egg, larva, and chrysalis of Anisopteryx pometaria, 84—Practical importance of distinguishing the two species, 85—Comparative description of the Spring and Fall Canker-worms, 86—Conclusion, 88—Extracts from the original essay on the Canker Worm by W. D. Peck, 89.	
Completion of its natural history, 90—The true sexual individuals discovered, 91—Epitome of the life-history of the Grape Phylloxera, 91—Different forms presented by the species, 93—Its power to change its habit, 93—Specific identity of the gall- and root-lonse, 94—Untrustworthy experiments made by the Department of Agriculture, 95—Proof of the identity of the two forms, 95—The gall-lonse is but a transient form, 96—Where do the winged females lay their eggs? 96—The winged female lays the egg wherever she is carried by the wind, 97—Particular part of the vine chosen by the winged female for laying her eggs, 98—The true sexual individuals, 98—Injury done by Phylloxera in America during the year 1874, 99—Range of the insect in America, 101—Does it occur in Sonth Carolina and Georgia? 102—The Phylloxera in California, 103—Injury done during the year 1874 in France, 103—Its spread in Europe, 104—Direct remedies, 105—Natural enemies, 106—Susceptibility of different varieties of grape-vine, 103—Grafting as a means of counteracting the work of Phylloxera, 108—Underground grafting, 109—Methods of grafting above ground, 112—Roots to use as stock, 115—Varieties to graft, 116—American grape-vines abroad, 116.	90
APPENDIX TO THE ARTICLE ON GRAPE PHYLLOXERA Synopsis of the American species of the genus Phylloxera, 117—The American Oak Phylloxera, 118; Its natural history, 119—Description of Phylloxera rileyi and the different forms presented by it, 119—Further points in its life-history, 120.	117
The Rocky Mountain Locust. Its natural history, 121—Method of egg-laying, 121—The egg, 122— The newly-hatched locust and its development, 122—Where the eggs are laid by preference, 123—The invading swarms are formed by a single species, 124—Differences between the Rocky Mountain and the Redlegged Locusts, 125—Mr. Thomas's description of the Redlegged Locust, 126—Variations, 126—Measurements of Caloptenus femur-rubrum, 127—Description of Caloptenus spretus and of its larva and pupa, 129—Measurements of Caloptenus spretus, 130—Summing up the difference between the two species, 132—Chronological history, 132—Locust invasions in the Old World, 132—Accounts of earlier locust invasions in America, 133—Chronological history of the Rocky Mountain Locust, 134—Earlier invasions, 135—Data regarding the invasion of 1867, 137—The invasion of 1873, 141—The invasion of 1874 in Missouri, 144—Questions addressed to correspondents in each county in Missouri regarding the locust, 144—Summary of the answers given by correspondents, 145—The invasion of 1874 in Kansas, 148—in Nebraska, 151—in Iowa and Minnesota, 153—in Colorado, 154—in Dakota and Manitoba, 155—Flight and ravages of a locust swarm, 156—Food plants, 158—Time of appearance of invading	121

The Rocky Mountain Locust-Continued.

swarms, 160 - Eastern limits of locust invasions, 161 - Native home of the species, 162 - Explanation of the migratory instinct, 164 - This locust cannot thrive in the Mississippi Valley, 164-It is a subalpine insect, 165 — What injury may be expected in Missonri in 1875, 166 — Ravages of migratory locusts in the Atlantic States, 167 — Description of the Atlantic Migratory Locust, 169 — Differences between Calontenus spretus, differentialis and atlanis, 170 - Injury from other, non-migratory, locusts, 171 — The Differential and Two-striped Locusts, 173 — Enemies and parasites, 174—Birds destroying locusts or their eggs, 174—The Silky Mite, 175-The Locust Mite and Dr. LeBaron's description thereof, 176 — The Anonymous Taehina-fly, 178 — The Common Fleshfly, 180 - Remedies, 181 - Classification of protective measures, 181 -Natural agencies, 181 — Destruction of the eggs, 181 — Destruction of the young wingless locusts, 182 - Driving off the winged locusts, 184 -Further suggestions, 185 — Loensts as food for man, 186 — The popular and scientific names of the insect, 187 - Prairie fires vs. the Rocky Mountain Locust, 189.

Appendix to the article on the Rocky Mountain Locust Letters of three correspondents from Texas and Kansas regarding Locust invasions, 191.

REPORT VIII.

[Published May, 1876.]

III Table of Contents V

NOXIOUS INSECTS.

The Colorado Potato-beetle Damage during the year, 1 — Abundant in Atlantic States, 1 — Swarming on Coney Island, 2-Injnring Egg-plant, 2-Its scientific name, 2-Additional enemies, 3 — Eaten by the Crow, 3 — Remedies, 3 — Cost of applying Paris green, 3—Preparing the poison, 3—Use of straw as a protection, 4 - Machine for sprinkling, 4 - Machine for brushing off the inscets, 4 — Experience with Paris green, 5 — Experiments of Profs. R. C. Kedzie and Wm. McMurtrie show that it may be used with safety, 6— Trial of other remedies, 6—The insect's native home, 8—The theory that it came from the Rocky Mountain Region essentially correct, 10-

Canker Worms..... Two species long confounded, 12—They differ generically; new genus (Paleacrita) proposed for one, 13—The two compared in all stages, 13, 14 — Characters of the genus Paleacrita, 17 — Distinguished as Spring and Fall Canker-worms, 17 - Practical considerations from their differences of habit, 18 - Stunting the larvæ does not produce male moths,

Poisonous qualities of the insect discussed, 10.

19 — Traps recommended, 20, 21. The Army Worm

Its generic name, 22 — The term "Army-Worm" applied to various insects, 23 — Past history of the Army Worm, 24 — Known since 1854 in Missouri, 27 — It followed the 1871 conflagration around Peshtigo, Wis., 28 — Its history in 1875; very general all over the country, 28, 29 — Its history in Missonri in 1875, 30 — Sexual differences, 30 — Sexual organs illnstrated, 30, 32 - Natural history of the species, 32 - Illnstrated in all states, 32, 33 — It occurs in Europe, Asia, New Zealand, and Austra-

The Army Worm-Continued.

lia, 34—Description of the egg, 34—Where the eggs are laid, 34—Conelusions drawn from structure, 36, 37—When the eggs are laid, 40—In what state does the insect hibernate?, 43—Habits of the Worm, 45—Why it escapes detection when young, 45—Why it travels in armies, 46—Time of its appearance, 46—Are there one or two broods?, 47—The Fall Army-worm, 48—How distinguished from the real Army Worm, 48—Plants preferred by the Army Worm, 49—Its sudden appearance and disappearance, 50—It swarms during wet preceded by very dry seasons, 51—Its natural enemies, illustrated, 52—Remedies, 54—Philosophy of winter burning, 54, 55—Prevention, 55—Summary of the leading facts concerning it, 56.

The Rocky Mountain Locust.....

Previous experience in spring 1867, 57 — Predictions verified, 58 — General ontlook in spring of 1875, 60 - Extent of country rayaged, 60 - The outlook in Missouri, 61 - Country ravaged often as bare as in midwinter, 61 - Account by counties, 62 - Atchison County, 62 - Andrew County, 62 - Benton County, 63 - Barton County, 63 - Bates County, 63 — Buchanan County, 64 — Caldwell County, 64 — Cass County, 64 — Clay County, 67 - Clinton County, 68 - Dade County, 68 - DeKalb County, 69 — Gentry County, 69 — Hickory County, 69 — Holt County, 69 — Henry County, 69 — Jackson County, 69 — Johnson County, 72 — Lafayette County, 73 - Nodaway County, 73 - Newton County, 73 -Pettis County, 73 - Platte County, 73 - Ray County, 74 - Saint Clair County, 75 — Vernon County, 76 — Condition of things in other States, 76 - Kansas, 76 - Nebraska, 79 - Iowa, 81 - Minnesota, 81 - Colorado, 84—Dakota, 85—Montana, 87—Wyoming, 88—Texas, 88—Indian Territory, 88 — Manitoba, 89 — Damage done in Missouri, 89 — Destitution in Missouri, 91 - Address of Relief Committee from Saint Louis Merehants' Exchange, 93 — Cases of starvation, 94 — The Governor's proclamation, 95 — The locusts not a divine visitation, 97 — Natural history; Mode of molting illustrated, 98—Habits of the unfledged young, 100— Directions in which the young travel, 101 - Rate at which they travel, 102 — They reached but a few miles east of where they hatched, 102 — Not led by "Kings" or "Queens," 103 — The species taken for such, il-Instrated, 103, 104 — The exodus in 1875, 104 — Time of leaving of the winged insects, 104 - Direction taken by the winged insects, 105 - Destination of the departing swarms, 106-Native home of the species, 109 - Views previously expressed confirmed, 110 - Conditions of migration, 112 - Conditions which prevent the permanent settlement of the species in Missouri, 113 - Modification of the species by elimatic eonditions, 114, 155 — Definition of the species, 114 — How distinguished in all stages from species most nearly allied, 117 - Experience in spring of 1875, 118 — Contrast in summer and fall, 119 — No evil without some eompensating good, 120 — Injury to fruit and fruit trees, 121 — Food plants, 121 - Only one kind of plant not touched under all eirenmstances, 121 - Chauges that followed the locusts, 121 - The widespread appearance of a new grass, ordinarily unnoticed, 122 — Appearance of large Worms, 123 - The Locusts did not return in the fall, 124 - Natural enemies, 124 — Remedies against the unfledged insects, 125 — Artificial means of destroying the eggs, 125 - Various means of destroying the unfledged young, 126 — They are within man's control, 126, — The proper ditch to make, 128-Machines used in Colorado, 129-Best means of proteeting fruit trees, 130 — How to avert locust injuries, 131 — Pre-

Page.

The Rocky Mountain Locust—Continued.

vention, 131—Legislation, both national and local. 132—Bills before the Forty-fourth Congress, 133—Necd of a National Entomological Commission, 133—The bounties offered in Minnesota, 138—The requisites of a good bounty law, 138, 139—How a bounty law would work, 140—Suggestions, 140—Lessons of year, 142—Locusts as food for man. 143—They have been used from time immemorial, and are used extensively at the present day, 145—The Rocky Mountain species quite palatable, 146—Mode of preparation, 147—False opinions and predictions, 148—Unnecessary alarm caused by other species, 148—Injuries of native species in 1875, 150—Locust flights in Illinois in 1875, 151—They were composed of local species, 152, 153—Explanation of these flights, 154—Locust prospects in 1876, 155—No danger from them in Missouri, 156.

The Grape Phylloxera

The injuries not great in Missouri in 1875, 157 — Completion of its natural history, 157 — Where the winged female lays her eggs, 157, 161 — The sexed individuals illustrated, 158 — Description of the true female, 159 — Description of the impregnated egg, 159, 162—Practical considerations growing ont of these latest discoveries, 163—Decortication of the bark to destroy the impregnated egg, 163 — The insect may be imported from one country to another on euttings as well as rooted plants, 163 — Best time to attack the root-liee, 163-Phylloxera ravages in California, 163 - Great destruction around Sonoma, 164 - Need of action by the State authorities, 164 — Occurrence of Phylloxers in the Southern States, 164 - Report of Committee appointed by the American Pomological Society, 165—Its ocenrrence in Georgia, 166, 167—American Grapevines in Europe, 167 — Large demand for our vines, 167 — The American vines flourishing in Southern France where the European varieties perish, 167 — The orders for some varieties exceeded the supply, 168 — Probable future demand, 168.

INNOXIOUS INSECTS.

The Yucca Borer

The only North American Butterfly whose larva has the boring habit, 169—The arbitrary nature of classificatory divisions, 170—Butterflies and Moths not easily separated, 170—Biological history of the species, 171—Illustrations of all states, 171, 172—Habits of the larva, 171, 172, 181—Mode of pupation, 172, 180—Flight of the imago, 173, 181—Position of wings when the imago rests or walks, 173—Bibliographical notes, 173—Detailed descriptions of the different states, 174, 175, 181—Structural characters illustrated, 175—Affinitics of the species, 176—It is a true butterfly, belonging to the Hesperians, 178—Characters of the Castnians contrasted with those of Hesperians, 176, 177, 178—In classification it is better to widen than restrict in the higher groups, 179—Enemies of the Yucca Borer, 179—Concluding remarks, 179—Unsafe to describe species from mere drawings, 179.

NOXIOUS INSECTS—Continued.

Supplementary Notes on the Army Worm.....

Completion of its natural history, 182 — Oviposition of the Moth described, 183 — Eggs described, 183 — Conclusions previously arrived at verified, 184 — Description of the different larval stages, 184.

REPORT IX.

	Page.
[Published March, 1877.]	211,211
Preface	III
Table of Contents	1.
NOW YOUR AND THE PROPERTY.	
NOXIOUS INSECTS.	
Currant and Gooseberry Worms	1
There are several species having different habits, 1—Three which may be destroyed by similar methods, 1—Botanical details as to the Currant and Gooseberry, 2.	
The Gooseberry Span-worm	3
Its natural history, 3—Most destructive gooseberry insect in Missonri, 3—Generic nomenclature, 3—Characters of the moth, 4—Description of the egg, 4—Where the eggs are laid, 4—The insect single-brooded, 5—How it spreads, 5—A native species, 5—Its past history, 5—It prefers the Gooseberry to the Currant, 6—The moth is closely imitated by one which greatly differs structurally, 6—Parasites, 6—Remedies, 7—Other currant Span-worms, 7.	
The Imported Currant Worm	7
Belongs to the "False-caterpillars", 7—The different specific names it has received, 7—An imported species, 8—Its introduction and spread, 8—Independently imported at several castern points, 9—Its natural history, 9—How the eggs are laid, 10—Nature and habits of the Worm, 11—Characters of the parent flies, 12—Preventive measures, 13—Remedies, 13—White hellebore the best, 13—How best used, 14, 15—The worm is not poisonous, 16—Natural nemies, 17—It furnishes a forcible example of Arrenotoky or the power of producing male offspring without impregnation, 18—Results of Parthenogenesis in different insects, 18—It also furnishes an interesting instance of Defunctionation of special parts, 19—The saw of the female imperfect, compared with others, 20—Evolutionary bearings of this fact, 21—Descriptive, 21—Variation in the antennæ and wing veins, 22. The Native Currant Worm Wherein it differs from the imported species, 23—Its habits, 24—Where the eggs are laid, 25—How the winter is passed, 25—Its occurrence in	23
Missouri, 26 — Remedies, 26 — Descriptive, 26.	
The Strawberry Worm Also a False-caterpillar, 27 — It has a wide range, 27 — How the cggs are deposited, 28 — Character and habits of the Worm, 28 — Remedies, 28 — Descriptive, 28.	27
Abbot's White Pine Worm	29
Destructive power of the insects of its genns in Germany, 29 — Evergreens which it prefers, 30 — Habits and characters of the Worm, 30 — Variation in the autenua, 30 — Characters of the perfect flies, 30, 31 — How the	•
eggs ars laid, 31 — Natural enemies, 31 — Remedies, 32 — Descriptive, 32.	
LeConte's Pine Worm A more general feeder than Abbot's species, 32—The close resemblance of the Worms, 33—How they differ, 33—Descriptive, 33—Other species of the genus, 34.	32
The Colorado Potato-beetle Injury in the West in 1876, 34—Spread of the insect during the year, 34, 35—Its great abundance on the Atlantic coast, 35—Rate at which it traveled since 1859, 37—An average of 88 miles a year, 37—How it	34

47

The Colorado Potato-beetle—Continued.

traveled, 37; principally in the beetle state, and greatly assisted by man, 37—Its migrating habit, 38—Area invaded by it nearly 1,500,000 square miles, 38—Causes which limit its spread, 38—Will it reach the Pacific slope?, 39—How it affected the price of potatoes, 39—The modification it has undergone, 40—A mite parasite added to its natural enemies, 41—Its introduction to Europe, 42—A living specimen found last summer in the Bremen dock yards, 42—Could it live and multiply in Europe?, 43—Action taken by European governments to prevent its introduction, 44—Consideration of the Kearney "Potato Pest Poison", 45.

The Army Worm....

Further notes and experiments thereon, 47—Two generations produced annually at Saint Louis, and a probable third generation, exceptionally, 48—Summary of its natural history, 49.

A new enemy to wheat, 50 — First complaint of it in the East, 51 — First appearance in Kansas, 51 — Habits and natural history, 52 — The egg differs from that of the Army Worm, 53 — Wherein the worm is distinguished from its destructive congener, 54 — Two broods each year, 54 — Natural enemics, 54 — Remedies, 55 — Descriptive, 55.

The Rocky Mountain Locust....

It continues to interest the people of the West, 57 — Previous opinions justified, 57 — The invasion of 1876, 59 — Few in British America, 59 — Condition of things in Montana, 59—In Wyoming, 59—In Dakota, 59 — In Minnesota, 60; locusts and alkali soil, 61; good done by Governor Pillsbury, of Minnesota, 61 — In Colorado, 62 — In Iowa, 63 — In Nebraska, 64 — In Kansas, 65 — In Missouri, 66 — Flights in opposite directions at the same time, 66 - Counties in Missouri that were overrun, 67 - Red-legged Locust troublesome in East Missouri, 68 - Detailed reports from counties in Missonri, 68 — Andrew County, 68 — Atchison County, 68—Barry County, 68—Barton County, 69—Bates County, 69 — Benton County, 69 — Buchanan County, 69 — Cass County, 69 — Cedar County, 70 - Caldwell County, 70 - Clay County, 70 - Dade County, 70 - DeKalb County, 70 - Gentry County, 70 - Greene County, 71 — Harrison County, 71 — Henry County, 71 — Hickory County, 71 — Holt County, 71 — Jasper County, 72 — Jackson County, 73 — Johnson County, 73 - Lafayette County, 73 - Lawrence County, 73 - McDonald County, 74-Newton County, 74-Nodaway County, 74-Pettis County, 74—Platte County, 74—Polk County, 75—Ray County, 75 - Saint Clair County, 75 - Vernon County, 75 - In Indian Territory, 76-In Texas, 76-In Arkansas, 76-Destination of the departing swarms of 1875, 77 — They reached into British America, 78 — Sonrce of the swarms of 1876, 79 — Eastern line reached, 80 — Rate at which the insects spread, 80—Direction of flight, 81—Influence of wind in determining the course of Locust swarms, 81 - Locust flights east of the Mississippi, 81 — Geographical range of species, 82 — Causes which limit the spread of the Rocky Monntain Locust, 83 — Flights of Aeridium Americanum, 84 - Does the female of the Rocky Mountain Locust lay more than one egg-mass, 85—How the eggs are laid, 86—Philosophy of the egg-mass, 87—How the young locust escapes from the egg, 88—How it escapes from the ground, 90—Additional natural enemies, 91 - Animals which destroy the eggs, 91 - The Anthonyia Egg-parasite, 92 — The Common Flesh-fly, 95 — Other undetermined enemies of the eggs, 95 — Insects which destroy the active locusts, 98 — Experi-

Page.

The Rocky Mountain Locust-Continued.

ments with the eggs and conclusions therefrom, 99—Experiments to test the effects of alternately freezing and thawing, 99—Experiments to test the influence of moisture upon the eggs, 104—Experiments to test the effects of burying at different depths and of pressing the soil, 104—Experiments to test the effects of exposure to the free air, 104—The Omaha Conference, 106—Remedies and suggestions, 108—Destruction of the young or unfledged locusts, 108—Protection of fruit trees, 110—Legislation, 111—Act passed by the Missouri legislature, 111—Acts passed by the Kansas legislature, 112—Act providing for the destruction of locusts in Minnesota, 114—Area in which eggs were laid, 116—Condition of eggs, 117—Temperature of the winter of 1876—77, 120—Prospects for 1877, 121.

INNOXIOUS INSECTS.

The	Hellgrammite	125
	Its eurious egg-mass described, 126 — Resembling bird-dung at a distance,	
	126 — Where laid, 127 — The Egg-burster, 127 — Characters and habits	
	of the newly hatched larva, 127 — Difficulty of rearing it in still water,	
	128 — The eggs that have been hitherto mistaken for those of Corydalus,	
	128 — They are probably those of Belostoma grandis, 128.	
The	Yucca Borer	129
	It is single-brooded, 129 — Will thrive in the latitude of Saint Louis, 129 —	
	The larva molts quite often, 129.	

CORRECTIONS.

A list of errata is given for each volume, and they are here reproduced with such additional ones as were previously omitted. Where foreign terms were not properly accentuated in the Reports, it was often due to the imperfect "plant" possessed by the State printer. In counting lines the running page title is omitted.

REPORT I.

Page 8, line 21, for being read were.

Page 10, line 1, for Figure 3,3 read Figure 3,2.

Page 12, line 20, for last read 1866.

Page 12, line 3 from bottom, after February add (1867).

Page 12, line 13 from bottom, for verter read venter.

Page 14, line 24, for hermaphrodite read agamic.

Page 14, line 32, for females read males.

Page 15, line 10 from bottom, for muscle-shaped read mussel-shaped.

Page 22, line 2 from bottom, for pupas read pupæ.

Page 30, note, for F. read T.

Page 31, line 15, for 37° read 38°.

Page 32, line 4, for Kreitz read Kreutz.

Page 32, line 14 from bottom, for III read V.

Page 32, line 7 from bottom, for XIII read VIII.

Page 38, line 5, for Tredeim read Tredeeim.

Page 47, line 16, for far read for.

Page 50, line 7, for none the less read no more.

Page 53, line 28, for laid read lain.

Page 54, line 4 from bottom, for hatch read are deposited.

Page 56, lines 5 and 12, for to read at.

Page 58, line 15 from bottom, for Aspidiglossa read Aspidoglossa.

Page 64, line 26, omit again.

Page 67, line 11 from bottom, for class read branch.

Page 76, line 48, for Climbing Rustie read Climbing Cut-worm Moth.

Page 78, line 46, for unipunctata read unipuncta.

Page 86, line 21, and wherever they occur, for Guénée read Guenée; and for Guéneread Guen.

Page 87, line 11 from bottom, for F. read T.

Page 96, note, line 4, for West. read Wesm.

Page 112, line 3, for abreviated read abbreviated.

Page 114, line 1, after "inseet" read (Stiretrus fimbriatus, Say).

Page 120, line 30, after "Cottonwood" read (Pemphigus vagabundus, Walsh).

Page 123, last line, for eriosoma read eriosomatis.

Page 132, line 16, for ampelopsis read ampelopsidis.

Page 133, in heading, for Codling read Berry Moth.

Page 133, line 24 from bottom, for preceding insect read Grape Curculio.

Page 134, line 3 from bottom, for Part V read Part VI.

Page 142, under the heading, add (LEPIDOPTERA TORTRICIDE).

Page 150, line 26, for thyridopteryx read thyridopterigis.

Page 150, line 37, for ferruginuous read ferruginous.

Page 154, in the heading, for zeas read zew.

Page 155, line 13, for ZEAS read ZE.E.

Page 161, line 38, for Trallien read Trallian.

Page 166, under heading, add (LEPIDOPTERA, PYRALIDE).

Page 171, line 3 from bottom, for transformation read transformations.

Page 173, line 3 from bottom, for it read the more liquid parts.

Page 174, line 3 from bottom, for Solidaga read Solidago.

Page 175, line 32, add front before wing.

Page 176, line 21, for through read into.

Page 177, line 26, strike out in.

Page 177, line 13, after coxa read trochanters.

Page 178, lines 2 and 3, for GELECHIA read GELECHIE.

Page 179, line 32, for assimilating read assimulating.

Page 179, in heading and line 12, for CHICKWEED read KNOTWEED.

Page 179, lines 12, 13, for (Stellaria media) read (Polygonum aviculare.)

Page 180, line 7, for Cersium lanceolata read Cirsium lanceolatum.

REPORT II.

Page 8, line 14 from bottom, for I have read has been.

·Page 8, line 13, from bottom, before on read largely from Mr. Walsh's previous writings.

Page 13, line 25, for cupable read eulpable.

Page 16, line 13, for lava read larva.

Page 23, line 6 from bottom, for hole read holes.

Page 32, line 17, for insect read insects.

Page 35, line 24, for Corimelana read Corimelana.

Page 40, line 23, for Ophinsa read Ophiusa.

Page 41, line 25, for Laphrygma read Laphygma.

Page 50, line 5 from bottom, for leuca[i] a read leucan[i] a.

Page 53, line 12, for perpulera read perpulchra.

Page 56, line 7 from bottom, for Salanum read Solanum.

Page 58, line 19, for eopalina read eopallina.

Page 59, line 9 from bottom, for varigated read variegated.

Page 76, line 4 from bottom, for I read V.

Page 76, line 5 from bottom, for Daphni read Daphne.

Page 82, line 25, for one read our.

Page 92, line 3, for 125-131 read 129-131.

Page 107, line 12, for Naturalista read Naturaliste.

Page 111, line 34, for crysalis read chrysalis.

Page 116, line 4 from bottom, for month read molt.

Page 118, line 2, for earved read curved.

REPORT III.

Page 6, line 3 from bottom, for Rosa read Rose; and for rosa read rosa.

Page 7, line 31, for Hyleactus read Hyleactus.

Page 25, line 8 from bottom, for finely read finally.

Page 28, line 3 from bottom, for Holmgreu's read Holmgren's.

Page 30, line 16, for the read the.

Page 30, line 16, for characterize read distinguish.

Page 47, line 3, for Feunde read Feinde.

Page 55, line 50, for that read than.

Page 57, line 18 from bottom, add e before the first h.

Page 58, line 3 from bottom, for fornudolosus read formidolosus.

Page 64, line 19, for Bignonio read Bignonia.

Page 78, note, for I read II.

Page 95, line 26, for belongs read belonging.

Page 117, line 5 from bottom, for Harr. read Fabr.

Page 123, last line, for an read and.

Page 129, lines 12 and 17, for Colosoma and Calosoma.

Page 131, line 13 from bottom, for fauns read fauna.

Page 135, line 33, for dints read dents; and line 21, for a read b.

Page 136, line 22, for Guenèe read Guenée.

Page 136, line 33, for Furtsenthum Walldeck read Fürstenthum Waldeck.

Page 145, line 35, strike out second the.

Page 146, line 24, add s to transformation.

Page 150, line 14, at end, add from an.

Page 151, line 12, for Cnythia read Cynthia.

Page 166, line 16 from bottom, strike ont first comma.

Page 166, line 6 from bottom, for phalangea read phalanga.

Page 169, line 33, for first i read e.

Page 170, line 10, for Nuaural read natural.

REPORT IV.

Page 6, first verse, for grow read grows.

Page 19, line 8, for 5 read 6.

Page 20, last line but one, for R read U.

Page 22, last line but one, for Aleochora read Aleochara.

Page 40, line 9 from bottom, for occular read ocular.

Page 41, line 59, for Vt. read Ct.

Page 41, line 15 from bottom, after "Larva" read Length 0.5 inch.

Page 42, line 5, add a comma after Lepidoptera.

Page 43, line 6 from bottom, for claud read eloud.

Page 46, line 29, for edgae read edge.

Page 46, line under heading, add a comma after Lepidoptera.

Page 47, line 30, for rhomboidally read trapezoidally.

Page 33, line 25, and page 54, line 27, for basillare read basilare.

Page 53, strike out all after for many in the note.

Page 59, line 10 from bottom, add winged before female.

Page 67, line 4 from bottom, for Cordifolia read Riparia.

Page 68, line 2 from bottom, for Oid read Oil.

Page 75, third line in heading, add a comma after Lepidoptera.

Page 103, third line of note, for insest read insert.

Page 105, line 8 from bottom, for ehrysallis read chrysalis.

Page 110, line 3, for CHALSIS read CHALCIS.

Page 110, line 29, for extramatis read extrematis.

Page 112, in the heading, for Hibn read Drury.

Page 132, line 19, for Chesnut read Chestnut.

Page 137, line 1, for Pernyi Silkworm read Perny Silkworm.

Page 137, under fig. 60, for Pernyi read Perny.

REPORT V.

Page 7, line 22, for stage read state.

Page 7, seeond line from bottom, strike out second the.

Page 8, explanation of Fig. 1, first line, for and read the.

Page 9, under Fig. 2, for BEMBEX FASCIATA read VESPA MACULATA.

Page 9, line 11, for last and read with the.

Page 11, line 9 from bottom, after worm add moth.

Page 11, line 3, from bottom, for four read eight.

Page 12, line 24, for ETEPOIS read ETEPOS.

Page 12, Fig. 5, for Euschistes read Euschistus.

Page 13, line 3 from bottom, for larvæ are read larva is.

Page 14, under Fig. 8, for ŒDIPODA DIFFERENTIALE read CALOPTENUS DIFFERENTIALIS.

Page 18, line 10 from bottom, for pollenation read pollination.

Page 19, line 30, for Lymexilon read Lymexylon.

Page 21, line 8 from bottom, for Townsend read Townend.

Page 24, line 13, for serial read aërial.

Page 33, in Fig. 15, for cloroform read chloroform.

Page 43, line 6 from bottom, after or add in.

Page 51, line 17, for J. S read S. J.

Page 56, line 24, for how read that.

Page 52, line 21, for petcolaris read petiolaris.

Page 58, line 16 from bottom, for decrepid read decrepit.

Page 61, line 18, for hypertrophized read hypertrophied.

Page 66, line 13, for Cordifolio read Cordifolia.

Page 67, line 27, for with read to.

Page 67, line 28, after and add to offer.

Page 83, line 13 from bottom, for who read as.

Page 85, line 17 from bottom, after fecundation add either the.

Page 85, line 18 from bottom, strike out either and after female add would.

Page 86, line 2 from bottom, for and read und.

Page 90, line 17, for had read has.

Page 100, last line, add a comma before say.

Page 101, line 10, for nole read noli.

Page 103, line 9, for Caryw read earyw.

Page 113, line 40, for 19 read 41.

Page 115, for exerted read exserted.

Page 120, line 25, for regulary read regularly.

Page 126, line 4 in note, for querciti read quereeti.

Page 126, line 5 in note, for pithicium read pithecium.

Page 129, line 14, omit color of the.

Page 139, for Papineau read Popenoe.

Pages 140 and 141, wherever Belvosia occurs read Belvoisia.

Page 156, line 6, for consumes read has consumed.

REPORT VI.

Page 8, last line, for 1874 read 1873.

Page 12, line 13, for Sisimbrium read Sisymbrium.

Page 12, line 25, for osciamus read oscyamus.

Page 12, lines 13, 14, for Poligonum read Polygonum.

Page 27, line 2 from bottom, for peeorus read pecoris.

Page 27, line 15 from bottom, for vireus read vireus.

Page 28, last line, for XV read XVI.

Page 35, line 3, for three read four.

Page 37, line 16, for first by read be.

Page 42, line 11, for the read certain.

Page 43, line 26, strike out to be presently treated of.

Page 47, remove "Telegraph" from "Summer grape" § to that of "Northern Fox."

Page 51, line 7 from bottom, for insidious read insidiosus.

Page 53, line 18, for Maguin read Mégnin.

Page 82, line 5 from bottom, for New read West.

Page 87, line 3 from bottom, for Bignonia read Bignonia.

Page 92, line 6, for Callimorpa read Callimorpha.

Page 94, line 14 from bottom, for point read joint.

Page 100, line 31, omit comma after lardarius.

Page 108, line 28, for orage read orange.

Page 111, line 6, for perspicillata read tripunctata.

Page 118, last line, for Phytopoga read Phytophaga.

Page 136, line 15, for Rosel von Rösenhof read Rösel von Rosenhof.

Page 141, line 9, after found add that.

Page 150, line 9, for pictures of read imprints on.

Page 154, line 6, strike out t.

Page 154, line 16, for it is read they are.

Page 156, line 8, after and add more.

Page 162, line 10, for elytram read elytrum.

REPORT VII.

Page IV, line 9, for contemptibly read contemptuously.

Page 1, line 10, after and read invaded the.

Page 5, line 16, for State read state.

Page 7, line 7, for calubrine read colubrine.

Page 11, line 32, for stoma read stomata.

Page 11, line 33, for dilutent read diluent.

Page 11, line 37, for J read S.

Page 12, line 13, for W. K read R. C.

Page 17, last line, for Dep. de l'Hèrault read Dép. de l'Hérault.

Page 21, line 14 from bottom, for LENCOPTERUS read LEUCOPTERUS.

Page 39, under Fig. 6, for TTIM read TRIM.

Page 52, line 14, for MeWallie read MeNallie.

Page 52, line 46, for Princeton read Purinton.

Page 75, line 32, for breed read bred.

Page 80, line 7 from bottom, add a comma before and after pometaria.

Page 81, last line, for nidi read nidus.

Page 94, in the sub-head, for Gall-inhabiting read root-inhabiting.

Page 99, line 7, in note, for nerves read tracheæ.

Page 108, line 17, for two read too.

Page 117, line 15, for V read IV.

Page 118, line 17 from bottom, for hight read height.

Page 147, line 20, for 1873 read 1866.

Page 162, line 20, for larva read lava.

REPORT VIII.

Page III, line 13 from bottom, add 1 before the 3.

Page 7, line 26, for eopper read soda.

Page 22, in notes, transpose the * and t.

Page 34, line 6, for tuliètes read tuélites.

Page 34, line 11, for three-hundredths read two-hundredths.

Page 37, under Fig. 23, for exerted read exserted.

Page 38, line 6, for glass read grass.

Page 52, line 1 in note, for Doliconyx read Dolichonyx, and for orizirora read oryzirora.

Page 53, line 32, for veridascens read viridascens.

Page 98, second line, in explanation of Fig., for e read e and for c read e.

Page 100, line 2, after they add are still imperceptible; in the third stage (after second molt) they.

Page 100, line 4, for third read fourth, and for second read third.

Page 100, line 7, for fourth read fifth, and for third read fourth.

Page 100, line 8, for fourth read fifth and for fifth read sixth.

Page 114, line 7 from bottom, for distinguish read distinguish.

Page 115, line 5, after histories add a comma.

Page 115, line 5 from bottom, for Pesotettix read Pezotettix.

Page 121, line 18, after limbs add and.

Page 149, under Fig. 46, for larva read pupa.

Page 150, line 10, for gran read granu.

Page 154, line 4 from bottom, for sheli read shell.

REPORT IX.

Page 6, line 26, insert after "moth" (Euphanessa mendica, Walk.).

Page 15, line 3, for entite read entire.

Page 29, in explanation of cut, for Abbott's read Abbot's.

Page 50, explanation of cut, for e read c.

Page 50, line 3 from bottom, for Hubner read Hübner.

Page 54, last line, in place of the comma, write is.

Page 55, line 1, for the other read the second.

Page 55, line 9 from bottom, for m. m read mm.

Page 55, line 7 from bottom, strike out the on.

Page 56, line 1, for m. m read mm.

Page 56, line 2, for the last and read anal.

Page 56, line 32, commence a new ¶ with "Chrysalis" and italicize it.

Page 57, in the heading for Spretus read spretus.

Page 58, line 14, strike out have.

Page 87, strike out the g in line 17 and also in figure.

Page 89, line 13, strike out the i after embryon.

Page 90, last line, for ambion read amnion.

Page 98, line 11 from bottom, for Compoplex read Campop'ex.

Page 98, line 6, add a comma before De Geer.

Page 98, note *, for Bastardii read Bastardi.

Page 98, under Fig. 28, for Bastardii read Bastardi.

NOTES AND ADDITIONS.

Under this head it is not my purpose to publish the many additional notes of observations which have been made by myself and others on the various insects treated of in the reports; but rather to indicate a few of the more important facts, especially such as are unpublished and bear on life-histories left incomplete. As, in preparing the reports, the older and better known generic nomenclature was almost uniformly employed, it is thought advisable to indicate in this bulletin the more recent nomenclature, and this is accordingly done either in these "Notes" or in connection with the reproduced "Descriptions of New Species" which follow:

HYMENOPTERA.

STIZUS GRANDIS Say (Rep. I, p. 27, Fig. 12)—This has been shown by Mr. W. H. Patton (Bull. U. S. Geol.-Geog. Survey, vol. V, p. 342) to be only a variety of *speciosus* Drury, which is the type of the genus *Sphecius* Dahlb.

CRYPTUS EXTREMATIS Cress. (Rep. IV, p. 111)—The questions in regard to the character of *C. samiae* Pack. have been settled by Dr. Hagen from an examination or the types (Bull. Buff. Soc. Nat. Sci., II, 206; 1875) confirming the conclusion which I came to. In Bulletin No. 3 of the Commission (p. 47) I have suggested that *extrematis* should sink as a synonym of *samia*, because two species (one of which is *nuncius*) were combined under it in the original description.

MICROGASTER MILITARIS Walsh (Rep. I, p. 89 and subsequently)—This is an *Apanteles* (See my Notes on N. A. Microgasters, etc. (Extr. from Trans. St. Louis Ac. Sc. IV), p. 19.)

Antigaster Mirabilis Walsh (Rep. VI, p. 162)—Mr. L. O. Howard has shown (Can. Ent. October, 1880. p. 209, and February, 1881, p. 31) that the habit of rolling back is not uncommon in the Eupelmides, and that Autigaster cannot well be separated from Eupelmus as at present understood.

COLEOPTERA.

Carabid Larvæ (Rep. IX, p. 97)—The second larva mentioned on this page was subsequently reared by me to the perfect state and proved to be *Amara obesa* Say. It will be found figured and described in the First Report of the Commission (p. 290).

Lebia Grandis, Hentz (Rep. III, p. 100)—This belongs to Chaudoir's genus *Loxopeza*.

Lebia atriventris Say (Rep. VIII, p. 3)—Belongs to Chaudoir's genus *Loxopeza*.

HIPPODAMIA MACULATA, DeGeer (Rep. I, p. 112 and subsequently)—Now referred to Mulsant's genus Megilla. It does not appear that this species occurs also in Europe as stated in the text.

Coccinella Munda Say (Rep. II, p. 25)—This is now considered synonymous with Cycloneda sanguinea Linn.

Coccinella Picta Randall (Rep. V, p. 101)—Now known as Harmonia picta.

MYSIA 15-PUNCTATA, Oliv. (Rep. IV, p. 18)—This has been referred to the genns Anatis, Mulsant.

Lachnostera Quercina, Knoch. (Rep. 1, p. 158)—This is synonymous with fusca Fröhlich, which has priority. The fungus affecting it (p. 158 and Rep. 6, p. 125) is Cordyceps ravenelii Berkeley. (See American Entomologist, III, p. 139.)

CHAULIOGNATHUS PENNSYLVANICUS, De Geer (Rep. I, p. 57 and subsequently)—This is now known as *Ch. americanus* Forst., the latter name having priority. For an account of the eggs and young larvæ, see Second Report of the Commission, p. 261.

Saperda Bivittata Say (Rep. I, p. 42)—This is now admitted to be a synonym of candida Fabr. For a correct description of the eggs and mode of oviposition, see an article by me in New York Weekly Tribune, Feb. 20, 1878.

BRUCHUS PISI Linn. (Rep. III, p. 44)—This name of the 12th edition of Linnaeus's "Systema Nature" gives way in modern catalogues to pisorum L. of the 10th edition.

FIDIA VITICIDA Walsh (Rep. I, p. 32)—This species is not mentioned by Crotch in his "Materials for the Study of the Phytophaga of the U.S." (Proc. Ac. Nat. Sc. Phil., 1873), but his Fidia murina (l. c. p. 33) is undoubtedly synonymous with Walsh's viticida, the latter name having priority by several years. In Crotch's "Check list" this species is also omitted, but the Fidia vitis Walsh in the "Omissions" to that list (p. 127) is probably meant for viticida.

Haltica Chalybea, Illiger (Rep. III, p. 79)—This belongs to the genus Graptodera Chevr.

Haltica cucumeris Harris (Rep. I, p. 101)—This is now referred to the genus *Epitrix*, Foudras.

Physonota Quinquepunctata Walsh & Riley (Rep. II, p. 59)—This is synonymons with *Ph. unipunctata* (Say), there being no question as to the specific identity of the two, both having been bred by Mr. F. H. Chittenden, of Ithaca, N. Y., from larvæ on a wild sun-flower (*Helianthus*).

Cassida Nigripes Oliv. (Rep. II, p. 63)—The eggs of this species are much like those of aurichalcea (Rep. II, Fig. 31) in size, form and color, though the spine-like appendages break off more easily. They may, however, be distinguished by being larger (1.6mm long without projections), having, in fact, nearly double the bulk, and by the flat posteriorly projecting piece which bears the spine-like appendages being generally greatly developed so as sometimes to extend beyond the apex fully one-third the length of the whole egg. Sometimes this piece divides distinctly into three spines, but in other cases it is quite blunt.

Cassida bivittata Say (Rep. II, p. 61)—The eggs of this species are pale and ovoid, just 1^{mm} long, but invariably covered with a yellowish secretion which dries and spreads out each side, and this by a black excrementitious material which gives the egg from above the appearance of an ovoid bit of excrement flattened on the adhering side. The eggs are laid singly or in twos or threes.

Cassida aurichalcea Fabr. (Rep. II, p. 62)—This is now referred to the genus Coptocycla Chevr.

Cassida pallida Herbst (Rep. II p. 62)—This is now recognized as a synonym of Coptocycla aurichaleca (Fabr.).

COPTOCYCLA GUTTATA, Oliv. (Rep. II, p. 63)—The eggs of this species, which I have often since observed, are deposited singly or in twos, threes or fours. They are rather more than 1^{mm} long, of the same general form and character as those of Cassida bivitata, but more narrow and elongate. The color is pale yellowish and translucent. The egg is always covered with a viscid fluid which dries to form a transparent covering verging to fulvous or gamboge in color. This covering almost always spreads out on each side of the egg in ray-like ridges, those on each side parallel and slightly oblique, and whenever the egg is single these ridges are remarkably regular and have a neat appearance. There is occasionally on the top of this a varying amount of ex-

crement. The structure of the covering is similar to that found in the egg of Cassida texana Cr. (which feeds on Solanum cleagnifolium), where, however, the ribs are finer and transverse, and there is no excrementitious covering. The newly hatched larva of guttata, like that of the other species is whitish, strongly recalling in general appearance an ordinary mite, the head not being concealed as it subsequently is, the hairs at the tip of the legs being frequently clavate or knobbed, and resembling those on the young of many Coccids. The marginal spines and the anal fork are quite well developed but simpler than in the subsequent larval stages. This newly hatched larva is quite nimble and crawls easily over glass.

Deloyala Clavata, Oliv. (Rep. II, p. 56)—Now referred to the genus Coptocycla.

BLISTER-BEETLES (Rep. 1, p. 96 ff.)—The larvæ feed on locust eggs. For account of their larval economy see my paper "On the larval Characters and Habits of the Blister-beetles," etc., Trans. Ac. Sc. St. Louis III, p. 544 ff.: also Reports of the Commission I, p. 292 ff.; II, 262 ff. Remarks on synonymy are also there given, but the following may be repeated.

LYTTA CINEREA Fabr. (Rep. I, p. 97)—This is now known as Macrobasis unicolor (Kirby).

LYTTA MURINA Lec. (Rep. I, p. 98)—This is a color variety of Macrobasis unicolor.

Lytta Marginata Fabr. (Rep. I, p. 98)—This is believed by Horn to be a color-variety of *Epicauta cinerca* (Forst.).

LYTTA ATRATA Fabr. (Rep. I, p. 98)—This is the *Epicauta pensylvanica* (De Geer) of Crotch's List.

ANTHONOMUS PRUNICIDA, Walsh. (Rep. III, p. 39) — Upon this species, which is a synonym of scutchlaris Lec., Dr. Leconte has since founded the genus Coccotorus (Proc. Am. Philos. Soc. vol. XV, 1876, p. 193).

CONOTRACHELUS NENUPHAR, Hbst. (Rep. III, p. 127, note) — The phytophagic variety of this species from Walnut and Butternut has since been characterized by Dr. Leconte as a distinct species, *C. juglandis* (Proc. Am. Philos. Soc. vol. XV, p. 226).

CŒLIODES INÆQUALIS, Say (Rep. I, p. 128) — Dr. Leconte has since founded upon this species the genus Craponius (Proc. Am. Philos. Soc. vol. XV, 1876, p. 268). The egg of this snout-beetle is quite large, bright yellow in color and deposited in a cavity half as large as the beetle, though the puncture leading to it is small. The lateral angularities or tubercles of the joints, as described by Walsh, are quite characteristic, and the dorsal view in my figure, given to show them, conveys a somewhat false impression of the larva, which is more or less curved, and has the general characteristics of Curculionid larvae. The figure is rather more attenuated than it should be. That the beetle hibernates I have since proved beyond question.

Baridius trinotatus Say (Rep. I, p. 93) — Dr. Leconte (Proc. Am. Philos. Soc. XV, 1876, p. 287) has since established for this and two allied species the genus *Trichobaris*.

SPHENOPHORUS ZEE Walsh (Rep. III, p. 59) — This has been previously described by Mr. Uhler as S. sculptilis (Proc. Ac. Phil. VII, 1855, p. 416).

SPHENOPHORUS PULCHELLUS Schenherr (Rep. III, p. 60) — As intimated in the footnote on the same page, this species is synonymous with Say's S. 13-punctatus, for which species and for Sphenophorus pustulosus Gyllh. Dr. Leconte has established the genus Rhodobænus (Proc. Am. Philos. Soc. vol. XV, 1876, p. 332). I have reared both, and also intermediate forms, from Helianthus in Texas, and Ambrosia in Missouri.

SCOLYTUS CARY.E Riley (Rep. V, p. 107) — Dr. Leconte (Proc. Am. Phil. Soc. XV, 1876, p. 371) has since decided that 4-spinosus Say is the 3 of this species, and Say's name consequently obtains.

LEPIDOPTERA.

Papilio Philenor Drury (Rep. II, p. 116) — Referred by Seudder to Hübner's genus Laërtias. For further notes and description of the egg and young larva, see Canadian Entomologist, January, 1881, p. 9, and American Naturalist, April, 1881, p. 327.

Danais Archippus, Fabr. (Rep. III, p. 143)—For further facts respecting the swarming and migrations of this butterfly, see the American Entomologist (III, p. 101), and for a fuller and more accurate account of the mode of pupation, see my paper on the "Philosophy of the Pupation of Butterflies and particularly of the Nymphalidæ" (Proc. Am. Ass. Adv. Sc. vol. XXVIII, 1880).

ÆGERIA ACERNI, Clem. (Rep. VI, p. 110)—Mr. D. S. Kellicott has an interesting article in the Canadian Entomologist for January, 1881, on the Ægerians inhabiting the vicinity of Buffalo, N. Y., in which he states that the chrysalis of this species in his locality does not agree with my description as "unarmed," if that description refers to the dorso-abdominal teeth. A reëxamination of my specimens shows that my statement applies to the absence of these teeth. It is, however, possible that there is some variation in this regard and that the eastern specimens from the Hard maple differ from the western ones from the Soft maple in having the teeth as indicated by Mr. Kellicott.

ARCTIA ISABELLA, Smith (Rep. IV, p. 143)—Referred to *Pyrrharctia* Packard. For further account of larval variation and parasites, see *American Entomologist*, III, p. 134 (June, 1880).

HYPHANTRIA TEXTOR Harr. (Rep. III, 130)—There is no doubt in my mind, from frequent breeding of specimens, that this is synonymous with *cunea* Drury and *punctulu* Fitch, which are but varieties, Drury's name having priority.

Callimorpha fulvicosta, Clem. (Rep. III, 132)—Grote and Robinson give the synonymy of this species in their "List of Lepidoptera of N. A.," etc., lecontei Boisd. having priority. The late Jacob Boll bred all the forms from larvæ feeding on the same species of plant.

Samia columbia Smith (Rep. IV, p. 107)—Mr. Herman Strecker has given a beantiful figure of the male of this species in his "Lepidoptera Rhopaloceres and Heteroceres, etc.," 1875 (Pl. XII, Fig. 3), and Mr. F. B. Caulfield has described and figured the larva (Canadian Entomologist, X, p. 41, 1878) showing that it is structurally identical with that of cecropia and differs only in the intenser green of the body, in the latera I tubercles and bases of the others being white instead of pale blue and in the upper thoracic tubercles being of a deeper coral-red. It accords more with the cecropia larva in the fourth stage. It is placed as a good species in Grote's "List of N. A. Platypterices," etc. (Am. Phil. Soc., 1874), but I am still of opinion that it should not be considered a distinct species but simply a well-marked local color-variety worthy of name. There is great variation in color, whether of the larva, cocoon or imago, in cecropia.

Callosamia angulifera, Walker (Rep. IV, p. 122, note)—This is still considered a good species by systematists. Mr. Jno. Akhurst, of Brooklyn, N. Y., informs me that he finds it rather constant from larvæ which seem to differ in no respect from those of promethea, but which feed on the Tulip tree (Liriodendron tulipifera), and make the cocoon near the ground without pedicel. I learn from Dr. Packard that Mr. Uhler has bred both it and promethia from the same lot of larvæ.

CLISIOCAMPA SYLVATICA Harr. (Rep. III, 121)—This is now referred to disstria Hübn., which has priority.

AGROTIS INERMIS Harr. (Rep. I, p. 72)—This is now recognized to be identical with the European A. saucia Treitschke.

NOCTUA CLANDESTINA Harr. (Rep. I, p 79)—An Agrotis.

AGROTIS TELIFERA Harr. (Rep. I, p. 80)—This is now recognized as the Enropean A. ypsilon Hüfn. = A. suffusa (S. V.) = A. ortonii Pack.

AGROTIS SUBGOTHICA Harr. (Rep. I, p. 81)—The moth represented under this name at Fig. 29, a, has since been described by Grote as A. herilis, and that at Fig. 29, b, has since been described by Lintner as A. tricosa. (Notes on some N. Y. Noctuidæ, Ent. Cont. III in Rep. N. Y. St. Mus. Nat. Hist., 1872, p. 159.)

AGROTIS JACULIFERA Guen. (Rep. I, p. 82)—This is the true *subgothica* of Haw. (See Grote, List of Noctuidæ of N. A., Bulletin Buffalo Soc. Nat. Sc. II, 1874, and Lintner *l. e.*)

AGROTIS DEVASTATOR, Brace (Rep. I, p. 83)—Grote refers it to Hadena.

CELENA RENIGERA Stephens (Rep. I, p. 86)—Referred by Grote to Hadena. Specimens in the Fitch collection marked with names (evidently from Walker) infecta, egens, defectua, subcadens? and murcimaculata seem to be all synonyms and mere variations.

PRODENIA AUTUMNALIS Riley (Rep. III, p. 116 and subsequently)—As stated in the 8th Report (p. 48) this in the more typical form is recognized as Laphygma frugiperda, 8m. & Abb. The variety obscura, as Prof. Zeller, who has seen it, informs me is so near the European exigua Hübn. that it is not easily distinguished.

PRODENIA COMMELINÆ, Sm. & Abb. (Rep. I, p. 88, and III, p. 113)—Dr. Leon F. Harvey (Bull. Buff. Soc. Nat. Sci., vol. II, pp. 274, 275; 1875) has since proposed specific names for two of the forms hitherto considered to be but varieties of commelinæ. The moth represented at Fig. 43, c, of the Third Report, is named by him flavimedia, that at Fig. 48, b, lineatella, the true commelinæ, being a larger species. From larvæ with the series of black triangles bordered exteriorly by a yellow line (such as are represented on Plate I, Fig. 12 of Rep. I, and at Fig. 48 a of Rep. III) I have bred the flavimedia. But larvæ found on cotton in the Southern States, and differing in having black triangles on the second joint only, and also varying greatly in coloration, have produced the same moth. Abbot's figure of the larva of commelinæ shows the full series of black triangles, but without any yellow exterior line.

GORTYNA NITELA Guen. (Rep. I, p. 92)—I have proved by breeding that G. nebris Gn. is but a large, southern form of this species. In the Southern States it is most common in stems of Ambrosia trifida, often producing a swelling or pseudo-gall. Both forms are indiscriminately bred with intermediate variations. See an article by Miss E. A. Smith (7th Report on the insects of Illinois, Cyrus Thomas, pp. 112-114) for additional food-plants and the habit of the younger larvæ to infest wheat-stalks, corn, etc. See also Am. Ent. I, p. 252; my "Potato Pests" (Orange, Judd & Co., 1877, p. 91) and Prairie Farmer, August 11, 1877. The insect normally pupates in the stem and when infesting thin stalks like those of most cereals and blue-grass (in which it is also found) often of necessity leaves one stalk for another.

Anomis XYLINA, Say (Rep. II, p. 37; VI, 17)—This has since been referred by Grote to Hiibner's Alctia argillacea, which has been generally adopted. See Bulletin 3 of the Commission on the Cotton Worm. While it will doubtless be found convenient in future to separate it from the other species of the genus Anomis, and Hiibner's generic name may therefore obtain, I must confess, after a careful examination of Hiibner's figure of argillacea, to grave doubts as to the correctness of Grote's reference thereto of our Cotton-worm Moth (xylina, Say). Hiibner's figure lacks several of the most constant characteristics of xylina. It is fulvo-testaceous shaded with brown, with the under side bright yellow. It lacks the three white specks on primaries and has a dark (orbicular?) spot in place of the outer one. It has a large white circular spot with black annulus in place of the dusky elongate discal spot with its double pupil. The wavy lines are almost black and differ in form; the fringes are unicolorous, and the abdomen is narrower. The figure more nearly represents in fact a species which I have received from Bahia, Brazil, and which differs from xylina, though the larva (also quite different) feeds on cotton.

We are all inclined to follow determinations of those who make a specialty of any group, but after due allowance for faulty coloring in Hübner's figure, I am constrained to believe that in this instance Mr. Grote has been in fault.

Canker-worms (Rep. VIII, p. 12)—For additional remarks as to the generic characters of the two Canker-worms, see my paper "On the differences between Anisopteryx pometaria Harr, and Anisopteryx ascularia W. V., with remarks on the genus Paleacrita. (Trans. Ac. Sc. St. Louis, Vol. III, p. 573 ff.)

GALLEREA CEREANA, L. (Rep. I, p. 166)—This is the mellonella L. of the 10th edition Syst. Nature.

PEMPELIA GROSSULARLE Packard (Rep. I, p. 140)—The Enropean Zophodia convolutella Hübn. (Phycis grossularicila Treitschke), which has precisely similar habits, closely resembles this species. In 1871 I compared it with this last in Mr. Stainton's collection and with specimens received from Prof. Zeller and could detect no essential differences. The European specimens are slightly larger, with broader wings and usually clearer, paler gray coloring. Colorational markings are, however, very variable in specimens from both sides of the Atlantic.

P. grossulariæ Packard was subsequently described by Grote as Dakruma turbatella (Bull. U. S. Geol.-Geog. Survey, IV, No. 3, p. 702; 1878). Dakruma scems to differ from Zophodia in nothing but the absence of the basal portion of the subcostal vein and possibly, although this character is not mentioned by Grote, in the recurved palpi. According to the synoptical table given by Heinemann, grossularia would fall in the genus Stenoptycha, distinguished from Zophodia by the recurved palpi. We may well question the generic value of this character, for different authors describe it quite differently: thus, Heinemann describes the palpi of Stenoptycha and Homeosoma as recurved, whereas Grote describes them as porrect in these two genera, if we accept his statement that Honora Grote is to be considered a section of Stenoptycha: thereappears also to be a difference in position in specimens of the same species, according as the palpi are heavily scaled or have lost the scales. From the known individual variation in the venation of these and other moths, especially in the hind wings, we cannot attach any specific, much less any generic, value to the slight difference in the subcostal vein of Dakruma noted above. Moreover, anthentic specimens of grossularia do not appear to possess this character of Dakruma. I am, therefore, of opinion that a study of sufficient material from both continents will prove the two specifically identical, or at the most that our American insect is a variety, and that Dakruma will not obtain. Packard is of this opinion, as in the later editions of his Guide the species is called Myeloi's convolutella.

PENTHINA VITIVORANA Packard (Rep. I, p. 133) — This is identical with a Enropean insect having the same habits. It was first described over a century since by Schiffermiller & Denis as Tortrix botrana, and has been referred to various genera since, and finally to Eudemis Hübn., so that the insect should be known as Eudemis botrana (Schiff.). Conchylis ambiguella (Hübn.) has very similar habits in Europe. See Nördlinger's "Die Kleinen Feinde der Landwirthschaft," p 424 ff. It is the Lobesia botrana of the later editions of Packard's Guide.

Euryptychia saligneana Clem. (Rep. II, 134). — This according to Prof. Fernald, who has seen the type, is the same as Clemens's Hedya scudderiana (Proc. Acad. Sci. Phila., 1860, p. 358), the description of which is very brief and presnmably taken from a female. The genus Euryptychia (Proc. Ent. Soc. Phila. V, 140) is founded on the male, which has a broad fold extending to the middle of costa on the primaries and covering up a pencil of yellowish hairs. Zeller subsequently redescribed it as Padisca affusana (Beiträge, etc., pt. III, p. 101 [307]). From a comparison of female specimens I am led to believe that this is the same species that is commonly known in Europeas Spilonota roborana Schiff., though in Standinger and Wocke's Catalogue cynosbana Fabr., described in 1875, is given the priority and aquana Hübn. is placed as a synonym. The obliquity of the edge of the basal dark patch and the details of the ocellated spot upon which species have been separated, I find to be variable.

The insect in Europe is known to feed on the leaf-buds of the rose. I have abundant proof that in this country it is not a gall-maker, but, as was inferred in the Report, an inquiline. I have found its larva feeding upon the flowers as well as amid the terminal leaves of the Golden-rod, and have also found it in other galls. When feeding in the more exposed positions it generally has a carneons or rosy tint.

ANCHYLOPERA FRAGARIÆ W. & R. (Rep. I, 142) — This has been referred to *Phoxopteris comptana* Fröhl., and while the two very closely resemble each other Prof. Fernald informs me that he yet believes *fragaria* to be distinct.

ŒTA COMPTA, Clem. (Rep. I, p. 151)—Notwithstanding Mr. Grote doubts the identity of this insect with Cramer's *Phalæna punctella*, there is no question in my mind about it, and I entirely agree with Zeller, who makes also the *Tinea pustulella* Fabr. a synonym (Beitr. z. Kenntn. N. A. Nachfalter II, p. 28). It was first described in this country in 1856 by Fitch as *Deiopeia aurea* (3rd Rep. Ins. N. Y., p. 168.) See also "Zygænidæ and Bombyeidæ of N. A." by R. H. Stretch, 1872, pp. 159 and 241.

The egg of this insect is one of the most singular Lepidopterous eggs with which I am familiar. I have found it numerously in the South in midsummer. It is 0.9 mm long, soft and plastic so as to be variable in form; but when laid (as it often is) on the web which the young larvæ make, where it takes on the more natural form, it is ovoid, somewhat compressed, with frequently a median ridge and one end narrowed and produced into a short neck. The color is cream-yellow and the delicate shell is corrugulate. It is laid singly and generally slightly attached by the broad side to the side of the mid-rib of the tenderest leaves, and its contact (by virtue, doubtless, of some poisonous liquid with which it is laid) causes a well defined swelling of the leaf-vein.

The species is placed among the *Zygwnidw* in Grote and Robinson's *List*, and has evidently more affinities therewith than with the *Teneidw*.

PRONUBA YUCCASELLA Riley (Rep. V, p. 150 and subsequently)—For further facts regarding this species, see my papers in Trans. St. Louis Ac. Sc. III, p. 568; American Entomologist III, pp. 141, 182, 293, and also a paper read before the American Association for the Advancement of Science at Boston, Aug., 1880, and to be published in the Proceedings of the Association for that year.

PTEROPHORUS PERISCELIDACTYLUS (Rep. III, p. 65)—This belongs to the genus Oxyptilus, Zeller.

HETEROPTERA.

Arma spinosa Dallas (Rep. II, p. 113 and subsequently)—Now referred to Stål's genns *Podisus*.

EUSCHISTUS PUNCTIPES, Say (Rep. IV, p. 19 and subsequently)—This is now known as Euschistus variolarius Beauv., this last having priority over Say's name.

Coreus tristis, De Geer (Rep. I, p. 113 and subsequently)—Belongs to Amyot & Serville's genus Anasa.

Micropus Leucopterus, Say (Rep. II, p. 15 and subsequently)—Now referred to Burmeister's genus *Blissus*.

ANTHOCORIS INSIDIOSUS, Say (Rep. II, p. 27 and subsequently)—Belongs to Fieber's genns *Triphleps*.

REDUVIUS RAPTATORIUS Say (Rep. I, p. 114)—Belongs to Sinea, Amyot & Serv., and is synonymous with diadema Fabr.

HARPACTOR CINCTUS Fabr. (Rep. I, p. 114 and subsequently)—Belongs to Stål's genus Milyas.

HOMOPTERA.

CICADA SEPTEMDECIM (Rep. I, p. 18)—This orthography, used in the Reports, is grammatically correct, but I find that Linnæus himself wrote septendecim (Systema Naturæ, Tom I, Pars II, 12th Ed. Stockholm 1767). Fitch used both forms of spelling, but Westwood, Harris and nost other authors follow Linnæus, and septendecim is, therefore, preferable. As to whether the 17 and 13-year broods should be considered specifically distinct, I am still of the opinion expressed in the First Report that the insects should not be looked upon as distinct species, but that tredecim Riley should rather be considered a race, or as Walsh (in a letter to Charles Darwin, which has kindly been shown me by Mr. G. H. Darwin) puts it, an incipient species, to which, for convenience, it is desirable to give a distinctive name. That it may be looked upon as a good species by excellent authority, will be seen by Walsh's discussion of the subject (American Entomologist II, p. 335) which I here quote:

What candid entomologist, who has worked much upon any particular order, will not allow that there are certain genera where it is often or almost or quite impossible

to distinguish species by the mere comparison of cabinet specimens of the imago? Lew and Osten Sacken have said this of the genus Cecidomyia in Diptera; Osten Sacken of two other Dipterons genera, Sciara and Ceratopogon; Norton of the genus Nematus in Hymenoptera; and Dr. Le Conte lately assured me that, although when he was a young man he thought himself able to discriminate, in the closet, between the different species of Brachinus in Coleoptera, he now considered it quite impracticable to do so with any degree of certainty. And yet who doubts the fact of the existence, in North America, of very numerous distinct species of Cecidomyia, of Sciara, of Ceratopogon, of Nematus, and of Brachinus.

Upon the same principle I strongly incline to believe that the 17-year form of the

Periodical Cicada (C. septemdecim, Linn.) is a distinct species from the 13-year form (C. tredecim, Riley) although it has been impossible for me, on the closest examination of very numerous specimens, to detect any specific difference between these two forms.* It is very true that the 13-year form is confined to the more sontherly regions of the United States, while the 17-year form is generally, but not universally, peculiar to the Northern States; whence it has been, with some show of plausibility, inferred that the 13-year form is nothing but the 17-year form accelerated in its metamorphosis by the influence of a hot southern climate. But as these two forms interlock and overlap each other in various localities, and as it frequently happens that particular broods of the two forms come out in the same year, we should certainly expect that, if the two forms belonged to the same species, they would occasionally intercross, whence would arise an intermediate variety having a periodic time of 14, 15 or 16 years. As this does not appear to have taken place, but, on the contrary, there is a pretty sharp dividing line between the habits of the two forms, without any intermediate grades of any consequence, I infer that the internal organization of the two forms must be distinct, although externally, when placed side by side, they are exactly alike. Otherwise, what possible reason could there be for one and the same species to lie underground in the larva state for nearly 17 years in one county, and in the next adjoining county to lie underground in the larva state for scarcely 13 years? I presume that even the most bigoted believer in the old theory of species would allow that, if it can once be proved to his satisfaction that two apparently identical forms are always structurally distinct, whether in their external or in their internal organization, they must necessarily be distinct species.

On the other hand, I firmly believe that many perfectly distinct forms, which at one time passed current, or which even now pass current, as true species, are in reality mere dimorphous forms of one and the same species. We find a good example of this in the dimorphous \mathcal{Q} Cymips, q. aciculata, O. S., which has already been treated of at great length. We find another good example of the same thing in Cicada Cassinii \mathcal{Q} \mathcal{Q} , Fisher, which is sufficiently distinct from the Periodical Cicada to have been classified as a distinct species, and yet never occurs except in the same year and in the same locality as this last, and what is more extraordinary still, is found not only along with the 17 year form (C. septemdecim), but also along with the 13-year form (C. tredecim).

Now, if Cassinii were a distinct species, and not, as I believe it to be, a mere dimorphous form of C. septemdecim and C. tredecim, the chances are more than a million millions to one against its always coinciding with the two other forms, not only as to

the particular locality but as to the particular year of its appearance.

I do not know that any one has heretofore attempted to set at rest, by actual proof, the very general skepticism as to this insect remaining so long underground, on the part of those persons who have given little attention to the subject. I have been able to trace the development from year to year of my tredecim brood XVIII in the vicinity of Saint Louis by digging up the larvæ each year from 1868 to 1876, and noting the annual growth. They could always be found within from two to five feet of the surface upon the roots of trees, and had by the 8th year attained the first pupa stage, and I have no doubt but that, at this writing, the true pupæ are nearing the surface of the ground to appear in myriads in the perfect state in May and June of this year.

The fungus affecting this Cicada has since been described by Mr. C. H. Peck as Massospora cicadina (31st Rep. N. Y. State Mus. Nat. Hist., pp. 44, 1879).

ERIOSOMA PYRI, Fitch (Rep. I, p. 118) — After comparing specimens in Europe with our American insect, I have no doubt of the specific identity of the two, or of the root-inhabiting and twig-inhabiting forms. The insect should be known, therefore, as Schizoncura lanigera (Hausm.). See my remarks in American Entomologist, II, 359;

^{*}For an excellent statement of the facts bearing upon this curious question, see a paper by Mr. Riley, the State Entomologist of Missouri, in No. 4 of the American Entomologist, and a still more complete one in his First Annual Report.

Rep. 3. p 95, and "Notes on Aphididæ of the U. S." (Hayden's Bull. U. S. Geol. & Geogr. Surv. of Terr., Vol. V, p. 3).

Aspidiotus Harrisii Walsh (Rep. I, p. 7)—This belongs to Costa's genus *Diaspis*, and is apparently the species named *ostroxformis* by Curtis (Gardener's Chronicle, 1843, p. 805).

DIPTERA.

TRUPANEA APIVORA Fitch (Rep. I, p. 168; II, 122) — This has been renamed *Promachus Fitchii* by Osten Sacken (Cat. of the described Diptera of N. A. 2nd Ed., 1878, p. 234), the species proving different from *Bastardii* Læw, and Fitch's name being preoccupied.

BEE-FLY LARVA (Rep. IX, p. 96) — The undetermined larva here illustrated (Fig. 24) has since proved to be that of a *Systachus*, a genus of Bombyliid flies. For further details and determinations see the Second Report of the Commission (pp. 262-9).

Sarcophaga Carnaria, L. (Rep. IX, p. 95) — The variety sarracenia of this species there mentioned is now considered a good species, for reasons stated in Bulletin 3 of the Commission (pp. 39, 40, note).

EXORISTA LEUCANEE, Kirkpatrick (Rep. II, p. 50 and subsequently) — Referred to the genus Nemorwa Desv. by Osten Sackeu (Catalogue, etc., 1878, p. 150). The variety ceeropiw of this (Rep. IV, p. 108) is quoted by him as a distinct species under Exorista, probably a mistake caused by my employing the wrong figure in the American Entomologist, Vol. II, p. 101, where that of E. flavicanda is used for leucaniw.

LYDELLA DORYPHORÆ Riley (Rep. I, p. 111)—Now included in the genus Exorista.

ORTHOPTERA.

Ecanthus niveus, De Geer (Rep. I, p. 138, and V, p. 120)—This species is common in all parts of the country, and I have proved, by breeding, that its eggs are those described and figured as such in the 5th Report. I agree with Scudder in considering fasciatus De Geer but a dark and rather well marked variety of it. Its chirp is intermittent, resembling a shrill te-reat te-reat with a slight pause between each. The eggs and punctures figured on page 119 of the 5th Report (Fig. 47) as probably those of Orocharis saltator are, as I have since proved by breeding and by watching the process of oviposition, those of a large species of Œcanthus, hitherto, I believe, very generally confounded with niveus, and which is described below as Œ. latipennis N. Sp. While niveus punctures all kinds of soft stems and pithy twigs, latipennis seems to prefer the more slender parts of the Grapc-vine. The female, when she has sufficiently proceeded in the act of ovipositing, is so intent that she can very well be watched at night by the aid of a "bull's-eye."

The jaws are first used to slightly tear the outer bark. With the antennæ stretched straight forward and the abdomen bent up so as to bring the ovipositor at right angles with the cane, she then commences drilling, working the abdomen convulsively up and down about twice each second. The eggs, as described in the Report, are laid lengthwise in the pith, but always in two sets, one each side of the hole. The number varies according to the size of the cane, and the distance between the holes is also variable but usually less than in my figure. The hole is usually filled up with a white mucous secretion, though there is very little of it about the eggs. This secretion also doubtless serves to facilitate the drilling. The same female will lay over 200 eggs, and will sometimes puncture the same cane at intervals of $\frac{1}{3}$ inch for $1\frac{1}{2}$ feet or more.

The shrill of *latipennis* is continuous and recalls the trilling of a high-pitched dogwhistle in the distance. The key varies, however, and is sometimes much less high and more musical than at others. The commingled shrill of this species recalls also the distant croaking of frogs in spring. The broad wings are thoroughly elevated during the act or even beut forward, and the vibration is so rapid that there appears to be no motion. The species, in addition to these differences in stridulation and habits, may be distinguished from niveus by the following characters:

ECANTHUS LATIPENNIS N. Sp.—White, the elytra of the \mathfrak Q sometimes grayish and the posterior femora in one specimen discolored. Antennæ immaculate, with the basal joints and the front of head usually roseate. Tip of ovipositor black. Pronotum as in niveus. Hind wings $\mathfrak Q$ as long at the elytra or sometimes a trifle longer; of $\mathfrak Z$ somewhat shorter than elytra. Elytra of $\mathfrak Q$ irregularly reticulate between the parallel oblique veins, especially toward the base. Elytra of $\mathfrak Z$ when unfolded $\mathfrak Z$ as wide as long, the dorsal surface 14^{mm} to 16.5^{mm} long by 7^{mm} to 8^{mm} wide; the rasp 1.5 $^{\mathrm{mm}}$ long and the teeth distinctly seen with a lens of low power. Ovipositor 6^{mm} long; subgenital plate broadly excavated. Claspers of $\mathfrak Z$ with their tips broad, but slightly broader at base than at tip, not deeply separated.

Described from 15 ₹ ♀ specimens from Missonri, 1 ₹ from Alabama, and 1 ₹ from

South Texas.

The form of the subgenital plate, the immaculate antennæ with their roscate base, and the larger size serve to distinguish the species as well in the pupa as in the imago state.

Œ. latipennis is a larger insect than niveus usually is. The ovipositor measures 6 mm in length, whereas in nireus it rarely exceeds 5mm and in only one specimen, a sanguineous variety eaptured July 10, 1874, does it equal 6mm. The male elytra of nivens in only one specimen, captured September 19, 1877, reach 13mm in length by 6mm in width on the upper face, and the size is generally much less. In nireus the unfolded male elytra are less than $\frac{2}{3}$, and usually only $\frac{1}{3}$, as wide as long, and the rasp is only 1mm long, and the teeth are not so easily seen. The elytra of niveus female sometimes show an irregularity in the reticulation between the parallel oblique veins but never so great an irregularity as in latipennis, there being fewer cells. In only one specimen of latipennis, a male taken on cotton at Columbus, Tex., are there any black marks on the lower surface of the basal joints of the antennæ, representing the lines or dots which are always present in niveus. But the two species are most sharply separated by the form of the subgenital plate of the female, which in niveus narrows rapidly towards the tip which has a minute angular notch, and by the form of the male elaspers, which in nivens have their tips very slender and parallel, being deeply parted, and then retreating rapidly from one another on each side.

Besides nivens there are recognized from North America three other species of Ecanthus, one of which, californica Sauss.,* recorded only from California, is described as having the posterior wings abortive.† The other two species, nigricornis Walk. from Illinois (description quoted in the American Entomologist, Vol. II, p. 207; 1870) and varicornis Walk. from Mexico, both described only in the female sex and differing from niveus in nothing but the slightly longer hind wings and the slightly greater size of the insect, and in varicornis having a slightly longer prothorax, have been retained as distinct species by Saussnre. But niveus, as may be seen in a series of specimens, varies in these characters indefinitely, just as other species of crickets are admitted to vary; so we may consider Walker's species to be but varieties of niveus. They cannot be referred to latipennis, for in this species the wings rarely, and then but slightly, exceed the elytra.

One other North American species, bipunctatus DeG., has been referred to Ecanthus. It belongs, however, to the genus Xabea and should be known as Xabea bipunctata (DeG.).

As the female of Xabea‡ has not hither to been described and Sanssure did not recognize the genus as distinct from *Ecanthus*, it may be well to give here the characters drawn from both sexes to show how very clearly the two genera differ. The type of the genus is from Sanatra, and Walker, being unacquainted with our species, an Sanssure, dhaving only imperfect specimens, both failed to recognize the existence of the genus in North America.

^{*}Études sur les Orthoptères, (in Mission Scientifique au Mexique, etc. Recherches Zoologiques 6^{me} partie.) 3^{me} livraison; p. 462; 1874.

[†]By "abortive" is evidently meant, from the description following the diagnosis, simply shorter than abdomen. In this respect and in the male (which alone is described) being shorter than niveus, californicus, which I know only from the description, may most easily be distinguished.

Walker, Cat. Derm. Salt. Brit. Mus., Pt. I, p. 109.

XABEA Walk.—First joint of antennæ armed with a stout, blunt tooth in front. Female clytra irregularly reticulated, the oblique longitudinal veins not being conspicuous; male clytra with the mediastinal vein strongly arenated; no humeral angle. Wings twice as long as the clytra. Cerci only half as long as the abdomen, sinnons. Outer valves of the ovipositor ending in a single outwardly directed tooth which is preceded on the outside by a longitudinal series of three teeth; the inner valves compressed, ending in three teeth of which the middle one is much the longest. Posterior tibiae with neither spurs nor serrations and having only 4 apical spurs, 2 within and 2 without; the first joint of posterior tarsi unarmed, the tarsi clearly but 3-jointed, the second joint short as in the other legs; tarsal claws with the inner tooth acute.

Orocharis saltator Uhler (Rep. V, p. 119).—The eggs figured and described on page 119 as probably those of this insect are, as above stated, those of Exauthus latipennis. I have, however, frequently obtained the eggs of the Orocharis since. In December, 1877, I watched a female ovipositing in the end of a dead and rather soft twig of the Soft-maple at Kirkwood, Mo. The twig had been pruned and the bark was somewhat gnawed by the cricket and the eggs thrust in irregularly from the end and from the sides. Both wood and pith were crammed with eggs, but all longitudinally inserted. The favorite nidus of the species is, however, the soft and somewhat corky, rough bark of the trunk and older branches of the American elm, the eggs being thrust in singly or in small batches, either longitudinally with, or very slightly obliquing from, the axis of trunk or branch. The female is very intent in the act, working her abdomen deliberately from side to side during the perforation. The ovipositor is held more obliquely than in Exauthus.

The egg is amber-colored and very slender and elongate, the tip rather pointed and very faintly opaque with the surface but slightly granulate. It has scarcely any eurve and varies from 3.5^{mm} to 4^{mm} in length and from 0.4^{mm} to 0.5^{mm} in diameter at middle.

The stridulation of this cricket is a rather soft and musical piping of not quite half a second's duration, with from 4 to 6 trills, but so rapid that they are lost in the distance. The key is very high, but varies in different individuals and according to moisture and temperature. It most resembles the vibrating touch of the finger on the rim of an ordinary tumbler when three-fourths filled with water—repeated at intervals of from 2 to 4 per second, and it may be very well likened to the piping of a young chick and of some tree frogs. As the species is very common in the Southwest its chirp is everywhere heard and is so distinctive that when once studied it is never lost amid the louder racket of the katydids and other night choristers. It is frequently heard during the day time in cloudy or damp weather, and I have heard it at Saint Louis the first days of November after a slight frost. The elytra in stridulating are raised less than in *Œcaathus* and are depressed at intervals.

The courting of the sexes is amusing. They face each other and play with their antennae for the best part of an hour or more than an hour. The female is, otherwise, pretty quiet, but the male continually mouths the twig or the bark npon which the courting is being done, and plays his palpi at a great rate, very stealthily approaching nearer to his mate meanwhile. At last the antennal feneing ceases and those of the female bend back and then the male approaches until their heads touch. He then deliberately turns round, elevates the elytra and slips his abdomen under the female, who virtually mounts and assists him, his elytra overshadowing her head.

The eggs of this insect, as also those of *Ecanthus latipennis*, are devoured by a parasitic larva of similar form and size, and which I have not yet reared to the perfect state.

ORGHELIMUM GLABERIMUM, Burm. (Rep. V, p. 123)—The egg-punctures illustrated at Fig. 56 are, as there correctly supposed, those of this species, as I have since proved by watching the act of oviposition and by rearing from the eggs. The insect is very fond of using the tops of corn-stalks for the same purpose.

NEUROPTERA.

Corydalus cornutus, L. (Rep. V, p. 141; IX, p. 125)—For additional facts relating to the early larval stages, see my notes on the "Larval Characteristics of Corydalus and Chauliodes and on the development of Corydalus cornutus (Proc. Am. Ass. Adv. Se., 1878).

MITES.

TROMBIDIUM SERICEUM Say (Rep. VII, p. 175 and subsequently)—For the natural history of this species and the specific identity with it of the larval form known as Astoma gryllaria LeBaron, and for further facts respecting the other mites mentioned in the Report, see my remarks in the Transactions of the Academy of Science of Saint Louis, (Vol. III, p. celxvii, October, 1877) in the American Naturalist for March, 1878, and in the First Report of the Commission (p. 306 ff.).

DESCRIPTIONS OF NEW SPECIES AND VARIETIES.

Some systematists have questioned whether descriptions of species in Agricultural Reports should be recognized. While my own views on this subject are pretty freely expressed on page 56 of my Third Missouri Report and elsewhere, the publication of this Bulletin affords a good opportunity to bring the descriptions that are scattered through the nine volumes together, with such notes on synonymy as present knowledge suggests, and such corrections as are given in the Errata. In the earlier reports the measurements were expressed in inches and hundredths of an inch, while in the later volumes the metric system was adopted as most convenient and accurate, and the measurements which follow have all been reduced to this standard. All changes of this character or other changes from the original are included in brackets, while the additional notes are in Long Primer type.

HYMENOPTERA.

PORIZON CONOTRACHELI, N. Sp.—Head pitchy-black, opaque, the ocelli triangularly placed and close together; eyes oval, polished, and black; face covered with a silvery-white pubescenee; labrum rufous, with yellowish hairs; mandibles and palpi, pale yellowish-brown; antennæ inserted in depressions between the eyes, reaching to metathorax when turned back, filiform, 24-jointed; black with basal joints 6-1 becoming more and more rufons, the bulbus always distinctly rufous; bulbus rather longer and twice as thick as joint 3; joint 2 about one-third as long. Thorax pitchyblack, opaque, the sides slightly pubescent with whitish hairs, the mesothorax rounded and bulging anteriorly, the scutellum slightly excavated and sharply defined by a carina each side; metathorax with the elevated lines well defined and running parallel and close together from seutellum to about one-fourth their length, then suddenly diverging and each forking about the middle. Abdomen glabrous, polished, very slcnder at base, gradually broader and much compressed from the sides at the apex which is truncated; peduncle uniform in diameter and as long as joints 2 and 3 together: joints 2-5 subequal in length; color rufous with the pednnele wholly, dorsnm of joint 2, a lateral shade on joint 3, and more or less of the two apical joints superiorly, especially at their anterior edges, black; venter more yellowish: ovipositor about as long as abdomen, porrect when in use, euryed apwards when at rest, rufous, with the sheaths longer and black. Legs, including trochanters and coxe uniformly pale yellowish-brown with the tips of tarsi dusky. Wings, subhyaline and iridescent, with veins and stigma dark brown, the stigma quite large, and the two discoidal cells subequal and, as usual in this genus, joining end to end, but with the upper veins which separate them from the radial cell, slightly clowed instead of being straight, thus giving the radial cell a quadrangular rather than a triangular appearance. 3 differs from ♀ only in his somewhat smaller size and nuarmed abdomen. Expanse♀0.32 inch [=8mm], length of body, exclusive of ovipositor, 0.22 [=5.5mm]; expanse 3 0.28 [= 7^{mm}], length 0.18 [= 4.5^{mm}].

Described from $3 \circ \circ$, $1 \circ$ bred May 26th-28th, 1870, from cocoons received from Dr.

I. P. Trimble, of New Jersey, and 1♀ subsequently received from the same gentleman—all obtained from larvæ of Conotrachelus nenuphar.

As I am informed by Mr. E. T. Cresson, of Philadelphia, who pays especial attention to the classification of the *Ichneumonidæ*, it might more properly be referred to Holmgren's genus *Thersilochus*, which differs from *Porizon* in the greater distance between the antennæ at base, and in the venation of the wing.—[Third Rept., p. 28, Fig. 9.

LIMNERIA LOPHYRI, N. Sp.—Q, length 0.30—0.35 inch [7.5—8,7^{mm}]. Head and thorax black with silvery white pile. Antennæ piceous, more than half as long as body; but slightly paler toward tip; bulbus either yellowish or rufons. Occili cither rufous or black. Mandibles, palpi, front and middle coxæ trochanters and tibiæ, pale yellow. Tegulæ almost white. Abdomen, with faint pile, rufous, the petiole and sides of next joint usually blackish. Hind legs rufous, the base of tibiæ and of tarsi paler.

3 somewhat smaller, and with more black on the abdomen.

Four &'s, 12 \sqrt{s} bred from larvæ of Lophyrus Abbotii.—[Ninth Rept., p. 32.

Hemiteles (?) Cressonii, [N. Sp.]—3—Length 0.25 [6mm]. Black, opaque, head transversely-subquadrate; face clothed with pale glittering pubescence; spot on mandibles, palpi, scape of antennæ in front and the tegulæ, white: eyes large, ovate; antennæ longer than head and thorax, slender, black; thorax closely and minutely punctured; mesothorax with a deeply impressed line on each side anteriorly; scutellum convex, closely punctured, deeply excavated at base; metathorax coarsely sculptured, truncate and excavated behind, the elevated lines sharply defined, forming an irregularly shaped central area, and a triangular one on each side of it, the outer posterior angle of which is prominent and subacute; wings hyaline, iridescent, nervures blackish, stigma large, areolet incomplete, the outer nervure wanting; legs pale honeyyellow, coxæ paler, tips of posterior femora, and their tibia and tarsi entirely blackish; abdomen elongate ovate, flattened, petiolated, the first segment flat, gradually dilated posteriorly, somewhat shining, and indistinctly longitudinally acculate; the two following segments opaque, indistinctly sculptured; remaining segments smooth and shining.—[First Rept., p. 177. Figured at Pl. II, Fig. 7.

HEMITELES (?) THYRIDOPTERIGIS, N. Sp.—♀ Length 0.36 [inch = 9mm]; expanse 0.50 [inch=12.5mm]. Ferruginous, opaque. Head transverse, rather broader than thorax, the front much depressed; face prominent centrally beneath antennæ, closely punctured, thinly clothed with pale pubescence; clypeus and cheeks shining; tips of mandibles black; antenna, long, slender, filiform, ferruginous, blackish at tips; thorax rugose; scutellum prominent, with sharp lateral margins; metathorax prominent, quadrate, abrupt laterally and posteriorly, finely reticulated and pubescent, the upper posterior angles produced on each side into a long, divergent, flattened, subacute spine; disk with two longitudinal carina, from which diverges a central transverse carina; tegulæ piceous; wings hyaline, subiridescent; a narrow, dark fuliginous band crosses the anterior pair a little before the middle, and a broad band of same color between middle and apex, this band having a median transverse hyaline streak; are olet wanting, second recurrent nervure straight, slightly oblique; apex of posterior wing fuscous; legs long and slender, ferruginous, more or less varied with fuscous; posterior coxe, tips of their femora, and their tibiæ and tarsi, fuscous; base of four posterior tibiæ more or less whitish, forming a rather broad annulus on posterior pair; abdomen petiolated, subconvex, densely and finely sculptured, blackish, basal segment tinged with reddish, the second and third segments distinctly margined at tip with whitish; apical segments smooth and shining, thinly pubescent; ovipositor half as long as abdomen, sheaths blackish.

3.—Not at all like the Q. Length 0.33 [inch = 8mm], expanse 0.44 [inch = 11 mm]. Long, stender, black, polished, without distinct punctures, thinly clothed with white pubescence; palpi white; antennæ long, stender; scape reddish; mesothorax gibbous, with two deeply impressed longitudinal lines; metathorax with well-defined elevated

lines, forming several irregular areas; sides rugulose, apex without spines or tubercles; tegulæ white; wings whitish-hyaline, subiridescent, the nervures and stigma white, subhyaline, neuration as in \mathfrak{P} ; legs long, slender, pale honey-yellow; coxæ, posterior trochanters, apex of their femora, and their tibiæ and tarsi, blackish; base of posterior tibiæ with a white annulus; abdomen long, slender, flattened, petiolated, smooth and polished, the apical margin of second segment being narrowly whitish.

Described from four \mathcal{G} and one \mathcal{J} specimens bred from the same [Thyridopteryx] cocoon.—[First Rept.p. 150. Figured at Pl. II, Figs. 11, 12.

The species is quite common in Washington, D. C., and is often attacked by a secondary Chalcid parasite.

MICROGASTER LIMENITIDIS, N. Sp.— \mathcal{J} Q. Length 0.09 inch [=24^{mm}]. Color pitchy-black. Antennæ black, about as long as body; palpi whitish. Thorax minntely punctured. Abdomen with the two or three basal joints emarginate and rngose, the terminal joints smooth and polished. Legs dusky; front and middle femora yellowish, hind femora black; front and middle tibiæ yellowish, hind tibiæ with terminal half dusky, but the spur pale; front and middle tarsi yellowish tipped with dusky, hind tarsi dusky above, paler below. Wings hyaline, iridescent, the nervures and stigma black or dark-brown, the radial nervule, the cubital nervules and the exterior nervule of the discoidal cell, sub-obsolete.

Described from 6 \circ , 1 \circ , bred from larvae of *Limenitis disippus*.—[Third Rept., pp. 158, 159.

The specimens referred to in connection with this description as bred from *Gelechia gallæsolidaginis* prove to belong to a distinct species. Both species belong to the genus *Apanteles* Först. as at present accepted. See my "Notes on N. A. Microgasters" (Trans. Ac. Sc. St. Louis, IV, *Author's separata*, p. 13.)

Microgaster gelechle.—Length 0.20 [=5mm] & Q.—Black, clothed with a short, thin, glittering, whitish pubescence, most dense on the face, which latter is closely punctured; occiput and cheeks shining; mandibles rufopiceous; palpi whitish; eyes pubescent; antennæ as long as the body in &, shorter in Q, 18-jointed; thorax shining, feebly punctured, mesothorax closely and more strongly punctured, with a deeply impressed longitudinal line on each side over base of wings; sentellum smooth and polished, the lateral groove broad, deep, arched and crenulated; metathorax opaque, densely rugose, with a sharp, central, longitudinal carina, and a smooth, flat, transverse carina at base; tegulæ testaceous, wings hyaline, iridescent, apex smoky, nervures blackish, areolet complete, subtriangular, radial nervure indistinct; legs pale honey-yellow, coxæ blackish, pale at tips, middle pair in Q concolorons with legs; abdomen with the two basal segments densely rugose and opaque, the remainder smooth and shining; venter more or less varied with pale testaceous.—[First Rept., p. 178.

This is a true Microgaster.

Perilitus indagator, N. Sp—Imago—Q, Head almost glabrous, transverse, deep honey-yellow, the trophi pale, except the tips of jaws, which are dusky; ocelli touching each other, black; eyes black, very large, occupying nearly the whole side of face, and with a few very short hairs; antennæ with about 24 joints, pale fuscous; reaching, when turned back, to about the middle of abdomen. Thorax honey-yellow beneath and very slightly pubescent; very finely punctured and slightly pubescent above; prothorax honey-yellow and prominently convex; mesothorax with lateral and posterior sutures black; metathorax black. Abdomen with the pedicel black and slightly punctured; depressed, narrow at base, widening behind, slightly pubescent above: the other joints glabrous, polished, deep honey-yellow, the second joint largest and as long as all the subsequent ones together; ovipositor extending about the length of the abdomen beyond its tip, rufous with the sheaths black. Legs

pale honey-yellow, the tarsi, especially at tips, slightly dusky, the hind femora and tibiae a little dusky towards tips, and a narrow rufous ring at base of former. Wings hyaline, iridescent; veins brown; stigma honey-yellow, with an opaque brown cloud; two cubital cells, the outer small, sub-quadrate; the radial large; one discoidal, long and narrow. Length, exclusive of ovipositor, 0.18 inch [= 4.5^{mm}].

Described from 1 9 bred from Acrobasis juglandis, LeB.—[Fourth Rept., p. 43.

Spathius trifasciatus, N. Sp.—Q. Average length, 0.18 inch [= 4.5^{mm}]. Color, light-brown. Head pubescent, palpi long and pale; eyes black; ocelli black, contiguous; antennæ smooth, pale, and reaching to second abdominal joint. Thorax with sutures dark-brown; legs more or less dusky, the tarsi (except at tip) an annulus at base of tibiæ, and the trochanters, pale; wings fuliginous, with a white fascia at base, at tip and across outer middle of front wing, including the inner half of stigma, the outer half of which is dark-brown; middle fascia most clearly defined. Abdomen slightly pubescent at sides and tip; first joint pale, petiolate, and with short and longitudinal acculations above; second joint pale above, the others more or less brown; ovipositor pale, dusky at tip, and long as abdomen.

One bred specimen.

3—Differs in being much darker colored, the head, thorax and femora being brown, and the metathorax and base of first abdominal joint black.

One bred specimen.—[Fifth Rept., p. 106.

Bracon Charus, N. sp.-9 Length of body 0.35 inch [=8.7^{mm}]; of ovipositor 0.40 inch [=10^{mm}]; expanse of wing 0.65 inch [=16^{mm}]. Colors black and deep rufous. Head, thorax, legs and antennæ polished black, the legs and sides of head and thorax with a fine grayish pubescence; trophi also black. Abdomen uniformly deep rufous. Terebra of ovipositor pale yellow, the sheaths black and very faintly pubescent. Wings deep fuliginous with a faint zig-zag, clear line across the middle from the stigma.

Described from 7 9's, all bred from Chrysobothris femorata.—[Seventh Rept., p. 75. Fig. 13.

Bracon scolythvorus, Cress.—Q—Black, shining, metathorax and base of abdomen pubescent; face, anterior orbits, lower half of cheeks, clypeus, mandibles, except tips, palpi, tegulæ, legs, including coxæ, and abdomen, honey-yellow, the latter darker; posterior coxæ sometimes dusky; antennæ at base beneath, dull testaceous; wings fuliginous, apical half paler, iridescent; abdomen shining, first segment whitish laterally, the base and disc sometimes dusky; base of second segment with a large subtriangular flattened space inclosed by a deep groove, the posterior side of which is generally blackish; ovipositor longer than abdomen; sheaths black; length, .15—.17 inch [= $3\frac{\pi}{4}$ — $4\frac{\pi}{4}$ mm].

&—More pubescent; posterior coxæ blackish, also the femora above, especially the posterior pair; posterior tibiæ dusky; abdomen black, polished; apex of first, basal half of second, and sides of apical segments more or less honey-yellow; sides of basal segment whitish; wings paler; abdomen narrower and rather more convex; length, .16 inch [$=4^{\text{mm}}$].

Three 3, three 2 specimens.—[Mr. E. T. Cresson, in Fifth Rept., p. 106.

SIGALPHUS CURCULIONIS, Fitch—Imago.—Head black, sub-polished, and sparsely covered on the face with short whitish hairs; occili touching each other; labrum and jaws brown; palpi pale yellow; antennæ (Fig. 7, c) 27-jointed, filiform, reaching, when turned back, to middle joint of abdomen and beyond, the buibus and small second joint rufous and glabrous, the rest black or dark brown, though 3-10 in many specimens are more or less tinged with rufous; 3-14 very gradually diminishing in size; 14-27 sub-equal. Thorax black, polished, the metathorax distinctly and broadly punctate, and the rest more or less distinctly punctate or rugose, with the sides sparsely pubescent. Abdomen pitchy-black, flattened, the dorsum convex, the venter concave, and the sides narrow-edged and slightly carinated; the three joints distinctly separated and of about equal length; the first joint having two dorsal longitudinal carinæ down the

middle; all densely marked with very fine longitudinally impressed lines, and sparsely pubescent; (Dr. Fitch in his description published in the Country Gentleman, under date of September, 1859, states that these lines leave "a smooth stripe along the middle of its second segment and a large smooth space on the base of the third;" which is true of a few specimens, but not of the majority, in which the impressed lines generally cover the whole abdomen.) Ovipositor longer than abdomen, but when stretched in a line with it, projecting backwards about the same length beyond; rufous, with the sheaths black. Legs pale rufous, with the npper part of hind tibic and tarsi, and sometimes the hind femora, dusky. Wings subhyaline and iridescent, the veins pale rufous, and the stigma black. Length \mathfrak{P} , 0.15-0.16 inch [=3.7-4^{mm}], expanse 0.30 [=7.5 mm]; \mathfrak{F} differs only in his somewhat smaller size and in lacking the ovipositor. In many specimens the mesothorax and the eyes are more or less distinctly rufous.

Described from $50 \circ \circ$, $10 \circ \circ$, bred Jnne 23d-July 29th, 1870, from larvæ of *Conotra-chelus nenuphar*, and $2 \circ \circ$ obtained from Dr. Fitch.

Larva (Fig. 8, a)—White, with translucent yellowish mottlings.

Pupa (Fig. 8, $c \ \Omega$)—0.17 inch [=4\(\frac{1}{4}\)\text{mm}] long; whitish, the members all distinct, the antennæ touching hind tarsi, the ovipositor curved round behind, reaching and touching with its tip the third abdominal joint, which afterwards forms the apical joint of imago; five ventral joints, which in the imago become much absorbed and hidden, being strongly developed.

Cocoon (Fig. c, b)—Composed of one layer of closely woven yellowish silk.

VARIETY RUFUS—Head, thorax, and most of the first abdominal joint entirely usous, with the middle and hind tibiae dusky, and the ovipositor three times as long as abdomen and projecting more than twice the length of the same beyond its tip.

Described from three QQ bred promiscuously with the others. This variety is slightly larger and differs so remarkably from the normal form that, were it not for the absolute correspondence in all the sculpturing of the thorax and body, and in the venation of the wings, it might be considered distinct. The greater length of the ovipositor is very characteristic, and accompanies the other variation in all three of the specimens.—[Third Rept., p. 27. Fig. 7.

Eurytoma Bolteri, N. Sp.— $\mathfrak Q$ Length 0.18 inch [=4.5 mm]. Antennæ black, not much longer than the face, perceptibly thicker towards the end, and apparently 10-jointed, though the three terminal joints are almost always confluent. Dimensions and appearance of joints, represented in the annexed Fignre 97, a. Head and thorax roughpunctured and finely bearded with short, stiff gray hairs. Abdomen about as long as thorax, scarcely so broad, viewed from above, but wider viewed laterally; highly polished, smooth and black, the three terminal segments with minute stiff gray hairs along the sutures; visibly divided into seven segments, the four anterior ones of about equal length, the two following shorter, and the terminal one produced into a point. Legs fulvous with the coxa, [trochanters], thighs and more or less of the shanks blackish-brown. Wings perfectly transparent, glossy, colorless, and with the nerves very faint.

& Measures but 0.14 inch [= 3.5 mm], and differs in the antennæ, being twice as long as the face, in their narrowing towards the tip and in being furnished with whorls of long hairs. The number of joints are not readily made out, and I have consequently presented at Figure 97, b, a magnified figure. His body is but half as wide and half as long as the thorax viewed from above, and not quite as broad as the thorax, viewed laterally; it it also lacks the produced point of the Q. His wings are also cut off more squarely and more distinctly nerved.—[First Rept., p. 187. Pl. II, Fig. 9.

For further descriptive details see Walsh's posthumous paper on the *Eurytomides* (Am. Ent. II, p. 298-9), where the insect is looked upon as a variety of *Eurytoma diastrophi*.

[TRICHOGRAMMA MINUTA, N. Sp.] * * * It comes nearest the genus Trichogramma, Westw., and may be provisionally called Trichogramma (?) minuta. It differs

from that genus and from all other Chalcididan genera with which I am acquainted, in the antenne being but 5-jointed (scape, plus 4 joints), the scape stout and as long, or longer, than joints 2, 3, and 4 together; joints 3 and 4 small and together as long as joint 2; 5 very stout, fusiform, and as long as 2, 3, and 4 together. The legs have the trochanters stout and long, the tibiæ not quite so long nor so stout as the femora, and with a long tooth; the tarsi are 3-jointed, with the joints of equal length and with the claws and pulvilli sub-obsolete. The abdomen is apparently 6-jointed, the basal joint wide, the 2nd narrower, 2-5 increasing in width till 5 is as wide as 1. The ovipositor of 2 extends a little beyond the apex, and starts from the anterior edge of the 5th joint.—[Third Rept., p. 158. Fig. 72.

The species was provisionally referred to *Trichogramma*, and I subsequently proposed for it the generic name *Pentarthron* (Record of Am. Ent. 1871, p. 8). *Pentharthrum* has, however, been used by Wollaston in beetles, and until allied genera are better characterized than at present, the old generic name may be retained.

COLEOPTERA.

BRUCHUS FABÆ N. Sp. (Fig. 19.)—General color tawny-gray with more or less dull yellowish. Body black tinged with brown and with dull yellowish pubescence, the pygidium and sides of abdomen almost always brownish. Head dull yellowish-gray with the jaws dark brown and palpi black; antennæ not deeply serrate in Q, more so in 3; dark brown or black with usually 5, sometimes only 4, sometimes 4 and part of 5 basal joints, and with the terminal joint, more or less distinctly rufous, or testaceous, the color being so slight in some specimens as scarcely to contrast at all with the darker joints. Thorax narrowed before, immaculate, but with the pubescence almost always exhibiting a single pale medio-dorsal line, sometimes three dorsal lines, more rarely a transverse line in addition, and still more rarely (two specimens) forming a large dark, almost black patch each side, leaving a median stripe and the extreme borders pale and thus approaching closely to erythrocerus Dej.; base with the edges almost angulated; central lobe almost truncate and with a short longitudinal deeply impressed median line; no lateral notch; scutel concolorous and quadrate with the hind legs more or lest notched. Elytra with the interstitial lines having a slight appearance of alternating transversely with dull yellowish and dusky; so slight however that in most of the specimens it can hardly be traced: the dark shadings form a spot on each shoulder and three transverse bands tolerably distinct in some, almost obsolete in others, the intermediate row being the most persistent and conspicnous: between these dark transverse rows the interstices are alternately more or less pale, especially on the middle of the 3rd interstitial lines. Legs covered with grayish pubescence, and with the tibie and tarsi, especially of first and second pair, reddish-brown; the hind thighs usually somewhat darker, becoming black below and inside, and with a tolerably long black spine followed by two very minute ones. Length 0.09-0.14 inch $[=2\frac{1}{4}-3.5^{\text{mm}}]$. Described from 40 specimens all bred from different kinds of beans. Hundreds of others examined.

This insect has been for several years ticketed in some of the Eastern collections by the name of B. fabæ, or else, what is worse, the corruption of it, fabi. The former name has been disseminated by my friend F. G. Sanborn of Boston, Massachnsetts, who says that he received the weevil thus named, together with beans attacked by it, in the year 1832 from Rhode Island. The name was credited to Fabricius, but I can find no notice in any of the works I possess of any European Bruchus fabæ, and several of my Eastern correspondents who have access to large libraries have been unable to find any description or allusion to a species by that name. Dr. LeConte has given it the MS name of varicornis but as his description will not appear perhaps for years to come and as no comprehensive description has yet been published, I have deemed it advis-

able to dispel in a measure the confusion that surrounds the nomenclature of the species. There is need of a description of so injurious an insect, and as *fabæ* is not preoccupied I adopt the name because it is entirely appropriate and because it is more easily rendered into terse popular language than *varicornis*.

It resembles most closely of any other species which I have seen, the *B. erythrocerus*, Dej., which, however, is smaller, and differs in having a narrower thorax which has light sides and a dark, broad dorsal stripe divided down the middle by a pale narrow line: *erythrocerus* is further distinguished by the antennæ being entirely testaceous and the hind thighs more swollen.

From obsoletus Say, fabæ differs materially: obsoletus is a smaller species, dark gray, with the antennæ all dark, the pygidium not rufous, the thorax with a perceptibly darker dorsal shade so that the sides appear more cinereous, a white scutel, and each interstitial line of the elytra with a slight appearance of alternating whitish and dusky along its whole length; for though there is nothing in Say's language to indicate whether it is the interstitial lines that alternate transversely, whitish and dusky, or each line that so alternates longitudinally, I find from an examination of a specimen in the Walsh collection, that the latter is the case, and so much so that the insect almost appears speckled. The two species differ both in size and color, though, as Say's description is short and imperfect it is not surprising that fabæ should have been referred to it.

From the European bean-feeding *Br. flavimanus* (which is apparently either a clerical error for, or a synonym of *Br. rufimanus*, Schenh.) as described by Curtis, it differs notably; as it does likewise from their *Br. serratus*, Ill., which also attacks beans.

Dr. LeConte, according to Mr. Rathvon, was inclined to consider this insect the obsoletus of Say, from the fact that in specimens which the latter gentleman sent him, the antennæ were not varied as in his MS. varicornis, but uniformly black. A few specimens which Mr. Rathvon sent me nearly two years ago, taken from the same lot as were those which he forwarded to Dr. LeConte, were singularly enough, all decapitated but two; and these two showed the varied antennæ. These specimens had all been kept in alcohol, and I am greatly inclined to believe that the uniformly dark appearance of the antennæ that was noticed by LeConte was the effect of the alcohol on those which naturally had the rufous joints but faintly indicated. At all events, though Mr. Rathvon tells me that he found a small proportion of beetles with dark antennæ, after examining, at my suggestion, over two hundred specimens that had thus been kept in alcohol; yet from over one hundred specimens which he had the kindness to send me, I only find (after thoroughly drying them) three with the terminal joint really as dark as the subterminal, and not a single one in which the rufons basal joints cannot be more or less distinctly traced.—[Third Rept., p. 55-56. Fig. 19.

Since the above was written, Dr. Horn has given us a revision of the Bruchidæ of the United States (Trans. Am. Ent. Soc., Vol. IV, 1873), in which he makes fabæ a synonym of obsoletus Say, expresses regret that another synonym must be added and states that the obsoletus which I referred to is the transversus Say (=hibisci Oliv.). This criticism is not deserved, and while the decision of one who has done such excellent work in Coleoptera as Dr. Horn has will be generally accepted as final, yet no one can compare his redescription of obsoletus with Say's description and not feel that the two apply to different insects. Fabæ is usually one-third larger, tawny-gray above with vari-colored antennæ, concolorous scutel, emarginate behind, and rufous legs and abdomen; obsoletus, on the contrary, according to Say, is blackish-cinereous, the thorax cinereous each side, with a whitish scutel and with the abdomen and legs not differing in color from the rest of the body. Fabæ breeds in beans; obsoletus in the seeds

of Astragalus. Indeed one would be far more justified in considering B. alboscutellatus Horn a synonym of obsoletus Say than in considering fabæ a synonym of it, and when the Bruchus from Astragalus in the Eastern States is bred, I fully expect Dr. Horn to change his mind. Nor is the assumption justifiable that the obsoletus referred to by me, and destroyed in the Walsh collection, is hibisci Oliv. It was far more like alboscutellatus as far as I remember, and there is not a character about this species which does not accord with Say's description of obsoletus except that the scutel is described as rounded, while that of obsoletus is described by Say as quadrate. I am of opinion that too much stress has been laid on this difference by Dr. Horn, as, when the pubescence is separated behind, the scutel appears quadrate, whereas in fabæ it appears bifid. The scutel of alboscutellatus when denuded is quadrate, but it is doubtless the clothed appearance which Say described. Say, as appears from his text, had abundant material, and it is assuming too much to suppose that he could overlook the striking differences in size and coloration of fabre, as above indicated.

The specific name fabæ was used by Brullé for Bruchus pisorum Linn.

Madarus vitis, N. Sp.—Length, exclusive of rostrum 0.10 [inch=2.5mm]. Color uniformly rufous, without maculations, the eyes alone being darker. Highly polished; rostrum arcuated, stout and about as long as thorax; thorax and body with extremely minute and distant punctures, anterior margin of thorax abruptly narrowed, especially laterally, into a collar; elytra slightly undulate, with 4 distinct elevations, one on the extreme outer margin close to the thorax, and one on the middle of each, near the extremity.—[First Rept., p. 132. Fig. 74.

For further details as to the synonymy of this insect, see American Entomologist I, p. 105. Dr. LeConte's description of Baridius sesostris was published about three months earlier than my own and he subsequently (Proc. Amer. Phil. Soc., Vol. XV, 1876, p. 299) erected the genus Ampeloglypter for this and two other species, so that Madarus vitis=Ampeloglypter sesostris Lec.

ANALCIS FRAGARILE, N. Sp.—Imago, (Fig. 14, b, c)—Color deep chestnut-brown, subpolished, the elytra somewhat lighter. Head and rostrum dark, finely and densely punctate and with short fulvous hairs, longest at tip of rostrum; antennæ rather lighter towards base, 10-jointed, the scape much thickened at apex, join 2 longest and robust, 3 moderately long, 4-7 short, 8-10 connate and forming a stout club. Thorax dark, eylindrical, slightly swollen across the middle and uniformly covered with large thimble-like punctures, and with a few short coarse fulvous hairs, unusually arranged in three more or less distinct longitudinal lines; pectoral groove ending between front legs. Abdomen with small remote punctures and hairs which are denser towards apex. Legs of equal stoutness, and with shallow dilated punctures and uniform very short hairs. Elytra more yellowish-brown, dilated at the lower sides anteriorly, and with about 9 deeply-punctured strice, the strice themselves sometimes obsolete; more or less covered with coarse and short pale yellow hairs which form by their greater density, three more or less conspicuous transverse bands, the first of which is at base; between the second and third band, in the middle of the elytron, is a smooth dark-brown or black spot, with a less distinct spot of the same color below the third, and a still less distinct one above the second band. Length 0.16 inch $[=4^{\text{mm}}]$.

Described from four specimens bred from strawberry-boring larvæ. The black spots

on the elytra are quite distinct and conspicuous on two specimens, less so on one, and entirely obsolete on the other.

Larva, (Fig. 14 a)—White with back arched Lamellicorn-fashion. Head gamboges yellow, glabrous, with some faint transverse striations above month; mandibles rnfontipped with black; labrum emarginate, and with palpi, pale. A faint narrow dorsal vasculer line. Legs replaced by fleshy tubercles. Length 0.20 inch [=5^{mm}] when stretched out.—[Third Rept., p. 44. Fig. 14.

Say's generic name *Tyloderma* having priority over Schönherr's *Analcis*, the name of this insect becomes *Tyloderma fragaria*.

LEPIDOPTERA.

ÆGERIA RUBI, N. Sp.—Imago.—Expanse, 3, 1.00 [inch=25mm]; Q, 1.25 inch [=31mm]. Front wings transparent, with a broad costal border extending half the width of wing at base, a narrow discal spot, and more or less of the tip dull-ferruginous; the inner border, the inner longitudinal vein, the intermediate space toward posterior angle, and sometimes its whole length, of the same color; veins brownish within and black without the diseal spot. Hind wings perfectly transparent, or rarely with a few sparse ferruginous scales; the transverse discal vein pale, the others pale at base, but black toward extremities; costa narrowly golden-yellow, becoming darker toward apex. Fringes dark-brown, those of hind wings appearing darkest by virtue of a dark wing border. Under surface somewhat paler. Abdomen stout, with a very slight anal tuft in Q; a stouter one in 3. Autennæ blue-black, not cularging toward tip, quite peetinate in 3. Palpi, a narrow ring around neck, the sides of the collar. a broad band curving across tegulæ and around the base of wings, a faint line across middle of thorax, two faint longitudinal lines between it and collar, legs, except outer base (sometimes whole length) of femora and tibie, hind third of abdominal joints, and a dorsal and lateral series of abdominal tufts or patches (the dorsal ones, especially on 3d and 7th joints, most persistent and conspicnons)-all golden-yellow: the rest of body black. The orbits are of a somewhat paler-yellow, and the face either gray or bluish.

 $\mathcal J$ differs from $\mathcal Q$ in the darker color of primaries, the narrower fringe of secondaries, the narrower ferruginous spot at apex of primaries, the more tufted abdomen, the broader and darker anal tuft, and the pectinate antennae.

Described from 6 3's, 6 \circ 's, bred from *Rubus*. Approaches nearest to *Trochilium marginatum* Harr., and *T. tibiale* Harr.,* from which it differs in the thoracie marks and the abdominal tufts.

Larva—Length 0.90-1.10 inch [=22.5-27.5 mm]; diameter 0.18 [=4.5mm]. Color pale-yellow. Head dark-brown, with a few whitish hairs; mandibles black, the other trophi paler. Cervical shield horny, pale-brown. Each joint with 8 pale, shiny piliferous spots, transversely arranged on 2, 3 and 12; the dorsal 4 quadrangularly arranged and the lateral 2 interrupted by stigmata on all the others. Thoracie legs slightly tinged with brown; prolegs, with the hooklets dark. Several specimens examined.—[Sixth Rept., p. 113. Fig. 30.

ACRONYCTA POPULI, N. Sp.—Larva—Length 1.50 [inch, = 37^{mm}]. Color yellowish-green, covered with long soft bright yellow hairs which spring immediately from the body, part on the back, and enrl round on each side. On top of joints 4, 6, 7, 8 and 11, a long straight double tuft of black hairs, those on 7 and 8 the smallest. Head polished black with a few white bristles. Joint 1 with a black spot above, divided longitudinally by a pale yellow line, giving it the appearance of a pair of triangles. Joint 2 with two less distinct black spots. Thoracic legs black; prolegs black with brownish extremities. Venter greenish-brown. Described from many specimens. When young of a much lighter color, or almost white, with the black tufts short but

more conspicuous, with a distinct black dorsal line, two lateral purplish-brown bands, and with hairs white, sparse and straight.

Individuals vary much: some have a black dorsal line, some have but three distinct black tafts; some have a sixth taft of black hairs on joint 9, and others have a few black hairs on all but the thoracic joints. Just before spinning up, many of the hairs are frequently lost, and the body acquires a dull livid line.

 $Moth. \rightarrow Q$, front wings, white, finely powdered with dark atoms which give them a very pale gray appearance; marked with black spots as follows: a complete series of small spots on posterior border extending on the fringes, one between each nerve; near the anal angle between nerves 1 and 2 a large and conspicuous spot bearing a partial resemblance to a Greek psi, placed sidewise, and from this spot a somewhat zigzag line running parallel with posterior border, but somewhat more arcuated towards costa, least distinct between nerves 3 and 4, and forming a large distinct dart-like spot between nerves 5 and 6; space between this line and posterior border, slightly darker than the rest of the wing-surface on account of the dark atoms being more thickly sprinkled over it; four costal marks, one subobsolete in a transverse line with the reniform spot, one conspicuous about the middle, and in a line with reniform spot and anal angle, one about the same size as the last and looking like a blurred X about one-third the length of wing from base, and one subobsolete, near the base; orbicular spot flattened and well defined by a black annulation; reniform spot indicated by a blurred black mark running on the cross-vein and sometimes somewhat crescent-formed; a V-shaped spot pointing towards base half-way between costa and interior margin, in a transverse line with the large costal spot which looks like a blurred X; a blurred mark in middle at base, and lastly a narrow spot on the inferior margin, half-way between base and anal angle. Hind wings same color as front wings; somewhat more glossy, with the lunule, a band on posterior border one-fourth the width of wing, and sometimes a narrow coincident inner line, somewhat darker than the rest; the posterior border also with a series of spots one between each nerve. Under surface of front wings pearly-white with an arcuated brown band, most distinct towards costa, across the posterior one-third, all inside of this band of a faint vellowish-brown; lunule and fringe spots distinct, and with a faint trace of the psispot; hind wings uniform pearly-white with a distinct and well defined dark wayy line running parallel with posterior margin across the posterior one-third of wing, and with the lunule and fringe spots distinct. Antenna simple and bristle-formed, gray above, brown beneath. Head thorax and body, both above and below, silvery-gray. Legs with the tarsi alternately dusky and gray. β differs from Q by his somewhat stouter antennæ; much narrower body, and narrower wings and fringes, the front wings having the apex more acuminate, and the hind wings scarcely showing the darker hind border.

Described from 2 9, 2 3 all bred. In the ornamentation of the front wings this species bears some resemblance to the European species tridens and psi, but otherwise differs remarkably, and especially in its larval characters. It bears a still closer resemblance both in the larva and imago state to the pale variety of a common species .known in England as the "Miller" (A. leporina), but judging from the figures and description in "Newman's Natural History of British Moths," it may be easily distinguished from leporina by the well defined orbicular spot, by the greater proximity of the two large costal spots, by lacking a round spot behind the disk, and by the more prolonged apex. It differs also in the larva state from leporina which feeds on the Birch. It likewise closely resembles interrupta, though the larvæ are remarkably different; and it also resembles lepusculina, the larva of which is unknown; but the specific differences will be readily perceived upon comparing Guenée's descriptions. How near it approaches to Aeronycta occidentalis, Grote, it is impossible to tell, as the author's description is exceedingly brief, considering the immber of closely allied forms; but as that species has a bright testaceous tinge on the reniform spot, it evidently differs from mine. Harris's Apatela [Aeronycta] Americana, though very different in the imago, yet closely resembles *populi* in the larva state. I have on two occasions found the larva of Americana feeding on the Soft Maple, and it may be distinguished from *populi*, by its greater size; by the paler color of the body; by the hairs being paler, more numerons, shorter and pointing in all directions, especially anteriorly and posteriorly of each segment; by having on each of joints 4 and 6 two distinct long black pencils, one originating each side of dorsum, and on joints 11 one thicker one originating from the top of dorsum; by a substigmatal row of small black spots (three to each segment, the middle one lower than the others) and by a trapezoidal velvety black patch starting from anterior portion of joint 11 and widening to anns.—[Second Rept., pp. 120, 121. Figs. 87, 88.

Grote refers it, in his List, to lepusculina Gn.; having, I believe, seen the type. Guenée must have had a uniformly colored and pale specimen as my typical specimens have a distinct orbicular mark, deeper subterminal markings and the terminal space contrasting by its darker gray with the rest of primaries—all unmentioned in Guenée's description.

XYLINA CINEREA, N. Sp.—Larva—Length when full grown 1.20—1.30 inches [=30—32^{mm}], color shiny silvery-green on the back, darker below. A medio-dorsal cream-colored stripe; a subdorsal one represented by 3 or 4 irregularly shaped spots on each joint. A broad deep cream-colored stigmatal line, with a few green dents in it, extending to anal prolegs. Four slightly elevated cream-colored spots, encircled by a ring of rather darker green than the body, in the dorsal space, and in the subdorsal space there are four or more similar but smaller spots. Venter glaucous-gray. Head as large as joint 1, free, glassy-green with white mottlings at sides and top, and pearly-white lips. Thoracic legs whitish. Prolegs concolorous with venter. When young the body is darker and the markings paler. Described from two living specimens.

Imago (Fig. 57, b)-Front wings, with the ground-color pale cinereous shaded and marked either with light brown, having a faint purplish tint, or with darker brown, having a similar reflection, or with a colder gravish-brown with the faintest mossgreen reflection: in the first two cases the dark color either blends and suffnses with the ground-color so as to give the wing a nearly uniform and smooth appearance, or . else contrasts sufficiently to bring out all the marks distinct; in the latter ease (two specimens) the markings are very distinct and the ground color is whiter and more irrorate. In the well-marked specimens the usual lines are readily distinguished, the basal half line, transverse anterior and transverse posterior being quite wavy, pale, and bordered each side with a dark shade, the median shade dark and well defined and the subterminal line, though sometimes pale near costa, forming a series of dark angular spots: in the more uniform specimens these lines are barely distinguishable and perhaps the most constant is the sub-terminal which most often takes the form of a series of dark angular spots: the ordinary spots have a pale inner and a more or less distinct dark outer annulation; the orbicular is larger than the reniform and is suffieiently double to take on the form of an 8, the upper part of which is always largest and with the interior space paler than the general surface, while that of the lower part is either concolorons or darker; the form is, however, quite irregular and differs sometimes in the two wings of the same species: the reniform spot is generally well defined, and is either darker, or has a tinge of reddish-brown, interiorly: at the base of the wing is a more or less distinct pale space occupying the upper half, and bordered below by a brown line which is straight about half its length and then extends upwards and outwards towards transverse anterior. A tolerably distinct terminal line, with the fringes dark. In taking a general view of the varying specimens this pale basal space, the pale upper part of the orbicular and the dark subterminal line, seem to be the most constant characters of the species. Hind wings gray-brown inclining to cinnamon-brown, with the posterior border but slightly darker and the fringe paler. Under surface quite uniform, that of front wings being nacrous gray with a faint discal spot and with a narrow costal and broad terminal border of pale fulvous, dasted with purple-gray; the hind wings of this last color with the lunule and line distinct. Head nearly entire, though the quadrifid arrangement of the hairs is traceable; palpi hairy throughout. Thorax quite square, of same color as primaries and with the collar bordered behind with brown and sometimes the edges of the tegulæ similarly bordered. Abdomen of same color as hind wings with lateral tufts, and cut off squarely at apex. Expanse 1.32—1.82 inches [=34—45mm].

Described from 3 specimens fed on grape-vine, 2 on peaches and 1 on Cercis canadeusis. Other captured specimens examined.

This species is the analogue of, and very closely resembles the European Xylina conformis, which is known under various synonyms. A specimen sent to Mr. P. C. Zeller of Stettin, Prussia, was, however, pronounced distinct. The well-marked irrorate form still more closely resembles Guenée's cinerosa found in Switzerland, and which he himself thinks may prove to be a variety of conformis. The more I study the species of the Noctuille as they occur in nature, the more I am struck with their great variability, and there can be no doubt that many of the so-called species will turn out to be but varieties when we better understand them. In this large family none but the more strikingly marked species should ever be described without an accompanying description of their preparatory states and of their principal variations. I am unacquainted with any of Walker's species except subcostalis, which is very different, and if this should prove to be a synonym of any of them the fault must be laid to the difficulty under which the naturalist in the Western States labors for want of proper libraries to refer to. It differs essentially from Grote's Bethunei and capax as described and illustrated in Volume I of the Transactions of the American Entomological Society. I am informed by Mr. [J.] A. Lintner of Albany, N. Y., that Dr. A. Speyer of Rhoden, Fürstenthum Waldeck, Prussia, who gives much attention to the Noctuidæ, has it marked Celana oblonga in his MS., but the insect evidently does not belong to that genus, and as the German pronunciation of Xylina much resembles the English pronunciation of Celana, the reference to the latter is doubtless due to a verbal misunderstanding.—[Third Rept., pp. 135, 136. Fig. 57.

Now referred, in Grote's List of Noctuida of N. A., to Hübner's genus Lithophane.

AMPHIPYRA CONSPERSA, N. Sp.—Larra.—Found full grown July 2, 1867, on Hazel. No pyramidal hump, and of a uniform emerald-green, the dorsal palpitations visible and the stigmata pale, with a black annulation, but with no other markings either on the head, body, or legs.

Imago—Like pyramidoides in every particular except that the brown of front wings is almost uniformly spattered over, more or less suffusely, with pale-grayish spots, so that no regular marks appear. The costal marks are, however, tolerably distinct as in pyramidoides, and by careful examination and comparison traces of the more conspicuous marks of that species may be discerned.

Described from one ♀ bred July 31.—[Third Rept., p. 75.

As remarked at the time, the specimen from which the description was made was a bred one and perfect. Grote, in his *List of Noctuide*, considers it simply an aberration of *pyramidoides*, but this can hardly be the case, as the larva also shows differences.

AGROTIS SCANDENS, N. Sp.—Larra.—Average length when full grown 1.40 [inch, =35^{mm}]. Ground-color very light yellowish gray, variegated with glaucous in the shape of different sized patches, which are distinctly see number the lens to be separated by fine lines of the light ground-color. A well-defined dorsal and less distinct

subdorsal and stignatal line, caused by these patches becoming larger and darker; another and still less distinct line of the same kind under stigmata. The dorsal line frequently with a very fine white line along its middle, especially at sutures of segments. Piliferous spots in the normal position; those above black, those at the sides lighter. Stigmata black. Head and cervical shield tawny, the latter with a small black spot each side, the former with two in front, and two eye-spots each side. Caudal plate tawny, speckled with black. Venter and legs glaucous. Bristles fine and small. Filled with food it wears a much greener appearance than otherwise, while when young it is of a more uniform dirty whitish-yellow, the lines less distinct but the piliferous spots proportionately larger. Head quite variable in depth of shade.

Perfect Insect.—Average length 0.70 [inch, = 17.5^{mm}]; alar expanse 1.50 [inch, = 37^{mm}]. General color of fore wings very light pearly blnish-gray, with a perceptible deepening posteriorly. Quite variable, sometimes of a more decided blne, at others inclining to buff as in Lencania unipuneta, Haw. Markings, when distinct, as in Plate 1, Figures 5 and 6. With the exception of the reniform spot and subterminal line, however, they are usually distinct only on costa, being either indistinct or entirely obsolete on the rest of the wing. The subterminal line is light, with a more or less dark diffuse shade each side, which, in some instances, forms into sagittate spots. A black stain at the lower part of reniform spot forms a most distinctive character. Hind wings very pale and lacking the bluish cast of fore wings; lumple distinct, and a dark shade, enclosing a lighter mark, as in Heliothis, along posterior margin. Eyes dark; head and thorax same as fore wings; abdomen same as hind wings. The whole under surface the same as hind wings above, the lumules and arcuated bands faintly traced, the fore wings having a darker shade in the middle.

Described from 30 bred specimens.—[First Rept., pp. 78-79. Pl. I, Figs. 5, 6.

AGROTIS COCHRANII, Riley-Imago.-Fore wings of a light warm cinereous, shaded with vandyke brown and umber, the terminal space, except at apex, being darker and smoky. Basal, middle and limbal areas of almost equal width, the middle exceeding somewhat the others. A geminate dark basal half-line, usually quite distinct. Transverse anterior geminate, dark, somewhat irregularly undulate, and slightly obliquing outwards from costa to interior margin. Transverse posterior geminate, the inner line being dark, distinct and regularly undulate between the nerves, while the outer line is plain and much paler; it is arounted superiorly and inversely obliques for two-thirds its width. Orbicular and reniform spots of normal shape, having a fine, dark annulation, which is however obsolete in both, anteriorly; the orbicular is concolorons with the wing, whilst the reniform has a dark inner shade with a central light one, and forms with the transverse posterior a somewhat oval spot which is also dark. Median shade dark and distinct interiorly, shading off and becoming indistinct in center of wing, and quite dark between the two spots, giving them a fair relief. Subterminal line single, light, acutely and irregularly dentate, with an inner dark shade, but warmer than that of terminal space. Terminal line very fine, almost black, slightly undulate. Fringes of same color as wing, with a light central line, having an outer dark coincident shade. A dark costal spot in basal area; at termini of the usnal lines, and two light ones in subterminal space. In some specimens one or two fine dark sagittate marks are discernable, and also a fine black claviform mark. Hind wings: whitish, with a darker shade along posterior margin. Under surface of fore wings somewhat lighter than the upper surface and pearlaceous interiorly, with a smoky arcuated band - more definite near the costa than elsewhere - and a tolerably distinct lunnle. Under surface of hind wings concolorous; slightly irrorate with brown anteriorly and posteriorly, and with an indistinct lunule and band. Autennæ, prothorax, thorax, tegulæ and body of same color as primaries, the prothorax having a darker central linc, and in common with the tegulæ a carneous margin. Under surface lighter; legs with the tarsi spotted.

This moth, in its general appearance, bears a great resemblance to *Hadena chenopodii*, but the two are found to differ essentially when compared. From specimens of *H*.

chenopodii, kindly furnished me by Mr. Walsh, and named by Grote, I am enabled to give the essential differences, which are: 1st. In A. Cochranii, as already stated, the middle area exceeds somewhat in width either of the other two, while in H. chenopodii it is but half as wide as either. 2d. In the Agrotis the space between the spots and between the reniform and transverse posterior is dark, relieving the spots and giving them a light appearance, whilst in the Hadena this space is of the same color as the wing, and the reniform spot is dark. The claviform spot in the Hadena is also quite prominent, and one of its distinctive features, while in the Agrotis it is just about obsolete.

There are specimens that seem to be intermediate between these two, but all those bred by me, both male and female, were quite constant in their markings, and their intermediates will doubtless prove to be distinct species or mere varieties.

Larra—Length 1.07 inches [=26.8nm]. Slightly shagreened. General color, dingy ash-gray, with lighter or darker shadings. Dorsum light, inclining to flesh color, with a darker dingy line along its middle. The sides, particularly along the sub-dorsal line are of a darker shade. On each segment there are eight small, black, shiny, slightly elevated points, having the appearance of black sealing-wax, from each of which originates a small black bristle. The stigmata are of the same black color, and one of the black spots is placed quite close to them anteriorly. Head shiny and of the same dingy color as the body, with two darker marks, thick and almost joining at the upper surface, becoming thinner below and diverging toward the palpi. The upper surface of first segment is also shiny like the head. Ventral region of the same dingy color, but lighter, having a greenish tinge anteriorly and inclining to yellow under the anal segment. Legs of same color. It has a few short bristles on the anterior and posterior segments.

Chrysalis.—Length 0.70 of an inch [= 17.5^{mm}]. Light yellowish brown with a dusky line along top of abdomen. Joints, especially of the three segments immediately behind the wing-sheaths, dark brown. The brown part of these three segments, minutely punctured on the back. Eyes dark brown, and just above them, a smaller brownish spot. Two quite minute bristles at extremity.

Described from numerous bred specimens. — [First Rept., pp. 75-76. Fig. 26.

There is little question but that this is the moth briefly characterized by Harris (Ins. Inj. to Veg., p. 444) as Agrotis messoria, an examination of the types confirming this view. A. repentis G. & R. and A. lycarum are also conceded by Grote to be synonyms.

PLUSIA BRASSICE, N. Sp. — Larva — Pale yellowish translucent green, the dorsum made lighter and less translucent by longitudinal opaque lines of a whitish-green; these consist each side, of a rather dark vesicular dorsal line, and of two very fine light lines, with an intermediate broad one. Tapers gradually from segments 1-10, descending abruptly from 11 to extremity. Piliferous spots white, giving rise to hairs, sometimes black, sometimes light colored; and laterally a few scattering white specks in addition to these spots. A rather indistinct narrow, pale stigmatal line, with a darker shade above it. Head and legs translucent yellowish-green, the head having five minute black eyelets each side, which are not readily noticed with the naked eye. Some specimens are of a beautiful emerald-green, and lack entirely the pale longitudinal lines. Described from numerous specimens.

Chrysalis — Of the normal Plusia-form, and varying from yellowish-green to brown. Moth — Front wings dark gray inclining to brown, the basal half line, transverse anterior, transverse posterior, and subterminal lines pale yellow inclining to fulvous, irregularly undulate, and relieved more or less by deep brown margins; the undulations of the subterminal line more acuminate than in the others, and forming some dark sagittate points; the basal half-line, the transverse anterior near costa, and the transverse posterior its whole length, being sometimes obscurely double: four distinct equidistant costal spots on the terminal half of wing, the third from apex formed by

the termination of the transverse posterior; posterior border undulate with a dark brown line which is sometimes marked with pale crescents; a series of similar crescents (often mere dots) just inside the terminal space; the small sub-cellulary silver spot oval, sometimes uniformly silvery-white but more often with a fulvous centre. sometimes free from, but more often attached to the larger one which has the shape of a constricted U, very generally with a fulvous mark inside, which extends basally to the transverse anterior at costa. Fringes dentate, of the color of the wing, and with a single undulating line parallel to that on the terminal border. Hind wings fuliginous, inclining to yellowish towards base, and with but a slight pearly lustre: fringes very pale with a darker inner line. Under surfaces pale fuliginous with a pearly lustre, the front wings with a distinct fulvous mark under the sub-cellulary spots, speckled more or less with the same color around the borders of the wing, the fringes being dentate with light and dark; the hind wings speckled with fulvons on their basal half, and with the fringes as above. Thorax variegated with the same color as front wings, the tufts being fulvous inclining to pink. Abdomen Q gray, with a few pale hairs near the base, and scarcely extending beyond the margin of the hind wings; & longer, covered with pale silky hairs, a distinct dorsal brown tuft on each of the three basal segments, and two large lateral either fawn-colored or golden-yellow brushes on the fifth segment, meeting on the back and partly covering two smaller brushes on the sixth, which are tipped with black; terminal segment flattened and with two lateral more dusky and smaller tufts: underside of thorax and abdomen gray, mixed with flesh-color. Alar expanse 1.55 inches. Described from numerous bred specimens. In a suite of specimens bred from the same brood of larvæ a considerable difference in the general depth of color is found, some being fully as dark again as others.

Closely resembles *Plusia ni*, Engr., which occurs in Italy, Sicily, France, and the northern parts of America. Mr. P. Zeller of Stettin, Prussia, to whom I sent specimens, considers it distinct however from the Europeau *ni*, and I have consequently given it a name in accordance with its habits.—[Second Rept., pp. 111-112. Fig. 81.

Notwithstanding its close resemblance to ni, the best authorities agree with Zeller in considering it distinct, as it certainly is. Strangely enough this same brassica, or what is extremely close to it, occurs also in South Europe and is figured in Stainton's Entomologist's Annual for 1870 as P. ni, one specimen having been found on the south coast of England, which specimen Zeller, as he wrote me, believes to have come from America. Standinger would probably characterize brassiee as a "species Darwiniana," and there are doubtless individuals of both the species which approach each other so closely as to be undistinguishable. There is such variation in the silver spot in either that it cannot be depended on alone, but Speyer (Europäisch-Americanische Verwandtschaften; Stettiner Ent. Zeit., June, 1875, p. 165) has presented other differences that are constant in detail, the most noticeable of which are the darker and more irrorate coloring and the interrupted and wavy terminal line of brassica, against the paler, smoother, more metallic coloring and the perfectly straight and unbroken terminal line of ni.

The larva is the most common cabbage pest in the Southern States, and is infested with an undetermined parasite. Mr. E. A. Popenoe has found it feeding on the leaves of *Crepis*, and what appears to be the same has been found by my assistants on Clover, Dandelion, *Senecio seandens*, and *Chenopodium*.

APLODES RUBIVORA. N. Sp. — Larva — Average length 0.80 inch [= $20^{\rm mm}$]. Color light yellowish-gray, darker just behind each joint, and very minutely shagreened all over. On each segment a prominent pointed straight projection each side of dorsum, and several minor warts and prickles below. Two very slightly raised, longitudinal lighter lines along dorsum, between the prominent prickles. Ten legs.

Perfect insect—Alar expanse 0.50 inch [=12.5^{mm}]; length of body 0.25 inch [=6^{mm}]. Color verdigris-green, the scales being sparse so that the wings appear sub-hyaline. Fore-wings with two transverse lighter lines dividing the wing into three parts, proportionate in width as 3, 4, 2 counting from base, and parallel with posterior margin; also a faint line between these two, running to about $\frac{1}{3}$ of wing from costa. Hind wings with two similar transverse lines, dividing the wing in like proportion, the outer line not parallel with margin, but wavy and produced posteriorly near its middle. Costa pale; fringes obsolete. Head, thorax and abdomen green above, but, together with antenna and palpi, white beneath.

Described from one ♀ specimen. — [First Rept., pp. 139-140. Pl. II, Fig. 25.

Dr. Packard, in his Monograph of the Geometred Moths, etc. (U. S. Geol. Surv. of Terr., Vol. X, 1876, p. 382), refers it to the genus Synchlora Gor., and adds the conventional ending to the specific name, so that the species becomes Synchlora rubivoraria. Synchlora albolineata Pack. and Eunemoria gracilaria Pack. are given as synonyms.

PHYCITA [ACROBASIS] NEBULO, Walsh—Imago.—I reproduce here the description of the moth in Mr. Walsh's original words: "Expansion of wings 7-10. Length of body 3-10. General color light cinereous, varied with dusky. A row of about seven subsemilunar or linear dark spots on outer margin of fore wing. Then one-fourth of the distance to the body a waving light cinereous band parallel to the exterior margin, marked on each side with dusky black. Nearly at the centre a much abbreviated black band. Beyond the centre on the costal margin a subtriangular dusky black spot, the apex of which connects with the apex of a much larger subobsolete triangular brickred spot which extends to the interior margin, and is bounded on the outside by a wayy light einereous band, which is again bounded by a wavy dusky black band proceeding from the apex of the costal triangle. Base of wing dusky black, inclosing a small round light cinereous spot. Hind wings and all beneath light cinereous shaded with dusky, the fore wings darker. Tarsi dusky with a narrow light cinereous fascia at the apex of each joint. Hind tibia fasciate with dusky at the apex, sometimes obscurely bifasciate. Intermediate tibia fasciate with dusky at the centre, the fascia generally extending to the base, but becoming lighter. Anterior tibia dusky, with a narrow apical light cinereous fascia. Palpi, both labial and maxillary, dusky."

When compared with other closely allied and resembling species, this little moth may be characterized in the following manner: The ground color of the front wing is decidedly bright and pale; the discal spots are almost always confluent, thus forming an abbreviated transverse bar; the dark markings are well defined and the triangular dark costal spots starting from the inner third of the wing is distinctly relieved, while the "brick-red" (nearer a cinnamon-brown) triangular spot which opposes it is large, so that the space it occupies on the inner margin is nearly as wide (generally within one-third) as that between it and the transverse posterior line. The lower half of the basal space is often of a distinct cinnamon-brown, and an oblique dusky band, which Mr. Walsh has not mentioned, is often quite distinct, running from near the apex to the brown triangle, where it connects with the inner margin. The species recalls, in facies, the European Myelois suavella. In a suite of specimens bred from Apple, Quince, Plum and Cherry, there is sufficient variation to prevent a too rigidly drawn description, but the above characters obtain in all of them, and such variation as occurs runs in the direction of the variety presently to be described.

Larva-[Length 0.5 inch] Brown or greenish in color. Cylindrical. [Tapering grad-

ually from first to last joint. Head and cervical shield darker than the rest of body, slightly shagreened, sparsely covered with long hairs, the shield quite large, convex, and occupying the whole surface between stigmata—there being in front of the latter a snb-cervical dark horny plate. Joints 2 and 3 wrinkled as at Fig. 18, c the former with two rather conspicuous dark dorsal piliferous spots. The other joints with a few fine hairs, the stigmata plainly visible, and the anal covering but slightly horny. Legs and prolegs of moderate size and of same color as body.

Described from numerous specimens.

Chrysalis—Mahogony-brown, with no striking character. Abdomen, especially above, with very minute punctures.

Variety Nebulella (Fig. 20, e).—I have bred a single specimen from wild Crab (Crategus) which differs in some essential features from the normal form, but which nevertheless can only be considered a variety of it, as I observed no larval differences. It differs in the more uniform and subdued tone of the front wings, the markings being more suffused and indistinct; but principally in the relative narrowness of the space outside the transverse posterior line the greater consequent width of the middle area, and smallness of the triangular brown spot—the space it occupies on the inner margin being scarcely one-half as wide as that between it and the transverse posterior line. The discal spots are also separated.

Described from one good specimen. An interesting fact connected with this variety is, that precisely the same form occurs in Europe, as I found a single specimen in the cabinet of M. J. Lichtenstein of Montpellier, France, which he had captured in that vicinity, and which he allowed me to bring home for comparison. It seems to be rare, even there, and whether indigenous or imported from this country, is a question yet to be solved.—[Fourth Rept., p. 41-42, Figs. 18, 19, 20.

ACROBASIS JUGLANDIS, LeBaron.—(Fig. 20, d)—I have bred this species from Hickory, but as Dr. LeBaron has also bred it abundantly from Walnut, and has signified his intention of describing it in his second annual Report, I adopt his proposed name, and shall content myself with pointing out the manner in which it may generally be distinguished from nebulo. Firstly, by the paler basal area of the front wings, which is sometimes almost white, especially near the costa, and by the head and shoulders and sometimes the β antennal horn partaking of this paler color. Secondly, by the darker median space, the dark triangular costal spot not being well relieved posteriorly, but extending so as sometimes to darken the whole space. Thirdly, by the discal spots always being well separated.

Such are its specific characters as taken from 3 hickory-bred and 6 walnut-bred specimens; but of the former there is 1 which when placed alongside of some of the more abnormal specimens of nebulo, can scarcely be distinguished from them, and, if chosen without knowledge of its larva, would certainly be placed with them; while of the latter there are two which nearly as closely resemble the variety nebulella. In general characters, in the size of the brown triangular spot, and the manner in which the inner margin is divided, juglandis is intermediate between nebulo and nebulella. In one of the hickory-bred specimens, the general color is quite warm, and the basal area carneous rather than white.—[Fourth Rept., p. 43. Fig. 20, a, b, d.

Dr. LeBaron published his description of it about the same time, under the name *Phycita juglandis*, in his Second Report on the Insects of Illinois, p. 123.

PEMPELIA HAMMONDI, N. Sp. Imago (Fig. 21, d).—Average expanse 0.48 inch [=12^{mm}]. Front wings glossy purplish-brown with two silvery gray transverse bands dividing the wing on costa in about three equal parts, the basal band sharply defined outwardly and always extending to inner margin, the posterior band never extending more than half way across the wing, and generally not more than one-third, illy defined. In some specimens the basal transverse band is quite narrow, with the basal space a shade paler than the median: in others the band forms a double line. In some

specimens also, a narrow pale transverse line outside the second hand, and a pale terminal shade, are visible. Hind wings uniformly paler gray. Under surface glossy gray, with no marks, the front wings a shade darker than the hind. 3 differs from 2 in the basal portion of the autennee being curved, and the curve filled with a tuft of scales.

Described from numerous bred specimens. The species has the general facies of the European Cryptoblabes bistriga, which is a larger insect.

Larva.—Length 0.45—0.50 inch [=11—12.5mm]. General color olive, or pale green. or brown, with a broad dark stripe along each side of back. Tapers slightly both ways, joints 4-12 inclusive, divided into two transverse folds. Freekled with numerous pale specks and with piliferous spots, the specks often taking the form of two pale broken lines along the upper edge of dark stripe. The piliferons spots are pale with a central black dot, and are best seen in the dark specimens. On joints 4-12 inclusive they are placed 4 in a square on the middle of the back, and four more each side, the two upper lateral ones being on the anterior fold, the stigmata appearing as minute rufous specks between them. Both these spots are often double. The third lateral spot is on the posterior fold and the fourth is subventral and anterior. The hairs proeeeding from these spots are long and setaceous. Head horizontal, freekled, pale behind, tinged with green in front and with a few long hairs. Joint 1 also freckled and with a large black piliferous tubercle with a pale basal annulation and in range with middle of dark stripe. Joint 2 with similar black tubercles with a white centre and replacing the uppermost lateral pale spot. There are but two of the small pale dorsal piliferous spots on this joint (between the tubercles) as well as on joint 3. Beneath immaculate, except that the thoracic legs have sometimes a few dusky dots.

In the very dark specimens the head, eervical shield and anal plate remain pale. The cervical shield is then well defined with four small piliferous specks at anterior edge, and the large shiny tubercle forms the extreme anterior angle.

Described from numerous specimens.

Pupa.—0.24 inch [=6^{mm}] long; rather stout and short, with two minute diverging spines and a few stiff bristles at tip.

In many specimens the subdorsal dark stripe is obsolete or sub-obsolete, but even then the four black tubercles on joints 1 and 2 characterize the larva sufficiently.—
[Fourth Rept., p. 46. Fig. 21.

Tortrix Rileyana, Grote—Larva—Length, Hickory feeding, 0.60-0.80 inch [=15—20mm]; Snowberry feeding, 0.40-0.50 inch [=10—12.5mm]. Largest on segment 2, tapering thence gradually to anus. Ground color dull yellow. Covered with large, distinct, black, sealing-wax-like, slightly elevated spots, each giving rise to several fine bristles. These spots are thus arranged on each segment: 2 each side of dorsum the posterior ones widest apart; 1 at sides in the middle of the segment, containing the stigmata in its lower hind margin; 1 smaller and narrower just below this, on a somewhat elevated longitudinal ridge, and 1 round one below this ridge on the posterior part of the segment. Segments 2 and 3 have but one spot each side of dorsum. Two distinct wrinkles on all the segments, more on 2 and 3. Head, cervical shield, and caudal plate black. Venter dirty yellow with black marks; legs ditto.

Chrysalis—Honey-yellow, robust in the middle, and with two transverse rows of minute teeth across the back of each segment.

Perfect Insect—From Hickory—Average expanse 1 inch, length of body, 0.35 [=8.8mm]. Deep ochreous. Fore wings evenly washed with purplish, leaving the fringes and costal edge dark ochreous. The markings take the shape of dark velvety brown rounded maculations, generally of small size and faintly shaded with ochreous on the edges. Three of these subterminally at the base of the wing, subequal, situated interspaceally between the nervures. At a little within the middle of the costa are two fused maculations, the most prominent. Before and beyond these, some faint costal marks. At at extremity of the discal cell, above median nervure, is the first of a

series of maculations, normally four in number but not constant, usually uneven in size. A subterminal series of spots is inaugurated on costa by a large, compound shaded maculation. Below this, over the median nervules, sweeps an outwardly rounded series of small approximate dots. Two dots on costa, within and at the apex, and a faint terminal series of minute streaks is shortly discontinued. Hind wings of a lustrous bright deep ochreous; pale along the costal margin and darker shaded along internal margin. Beneath, as are the hind wings above; both wings immaculate, fore wings the darker. Body and appendages concolorous, bright deep ochreous. Antennæ simple. Numerous bred specimens.

From Snowberry—var. symphoricarpi—Much paler, the fore wings not being as dark as the hind wings of the above. The upper surface of fore wings not washed with purplish but merely of a darker ochreous than the hind wing. The maculations entirely similar but ferruginous, paler and the slighter costal marks obsolete. Legs at base and under thoracic surface almost whitish. Average expanse, 0.62 [=15.5^{mm}]; length of body, 0.30 [=7.5^{mm}]. Described from numerous specimens. Under surfaces exactly alike in both varieties.—[First Rept., p. 154. Fig. 85, and Pl. 2, Figs. 3, 4.

Tortrix Cinderella, N. Sp.—Imago.—Alar expanse exactly 1-2 inch [=12.5^{mm}]. Front wings deep glossy ash-gray, immaculate. Under a lens they have an irrorate appearance, while in certain lights some of the scales appear to form a series of darker transverse sinuous lines. Also scattered over the wing may be noticed a dozen or more reddish scales, which are not sufficient, however, to destroy the uniform immaculate appearance. Head, mouth-parts, antennæ, legs, and abdomen of same color. Hind wings paler and semi-transparent. Fringes of all wings concolorous. Under surface of wings pale nacreous, inclining to pale fulvous around the margins.

Described from two bred specimens.

Larva (Fig. 22, a).—Length 0.50 inch [=12.5^{mm}]. Form of that of Acrobasis nebulo, wrinkled very much in the same manner. Color yellowish-green, the piliferous spots of the same color, but readily distinguished by their polished surface; they are placed in a transverse row on thoracic joints, and on joints 4—12 there are four trapezoidally on dorsum, two laterally on the first fold and one subventral. Stigmata between the two lateral spots, and yellowish. Head and cervical shield gamboge-yellow; only a shade darker than body; labrum and two basal joints of antennæ paler or white, the terminal joint brown; ocelli on a somewhat crescent-shaped black spot (the most conspicuous character) a second dusky spot at base of head laterally. Legs immaculate.

Described from many specimens.

Pupa (Fig. 22, b).—Length 0.25—0.30 inch [=6—7.5^{mm}]. Brown, characterized by a peculiar rounded projection from front of head; by a little pointed prominence at base of each antenna, and each side of penultimate abdominal joint; and by terminating in a broad suppressed piece which produces two decurved hooks. Posterior rim of abdominal joints rasped dorsally, and a slight rasped dorsal ridge near the anterior edge of larger joints. Legs reaching only to end of wing-sheaths. The head-prominence varies in size and slightly in form.—[Fourth Rept., p. 47.

From specimens reared from cranberry-feeding larvæ received from Mr. Jno. H. Brakeley, of Bordentown, N. J., I am satisfied that this is the same species briefly characterized by Packard in the 1st edition of his Guide (p. 334) as Tortrix oxycoccana, and that T. malivorana LeBaron (my Rep. IV, p. 47) is but a dimorphic orange form, subsequently described by Packard as T. vacciniivorana (Hayden's Report of the U. S. Geol. and Geogr. Survey of the Territories 1878, p. 522). The orange and ash-gray specimens are thus bred both from Apple and Cranberry. I have reared both forms from Cranberry and from Apple, and they are undistinguishable in the larva and pupa states. The gray form is often

more or less suffused with orange scales and the orange form less frequently with gray scales. This is the most remarkable case of dimorphism with which I am familiar in the family, and points strongly to the important bearing of biological facts on a true classification. The dimorphic coloring is not sexual, but occurs in both sexes. The eggs of this species are very flat, circular and translucent, with a diameter of 0.7 mm, and are laid singly on the underside of the leaf near the mid rib. The species belongs to the genus Teras, and as Packard's specific name oxycoccana has priority, the insect should be known as Teras oxycoccana, Pack. The insect, according to Mr. Brakeley, who gives an account of it in the Report of the Seventh Annual Convention of the New Jersey Cranberry Association (1879, p. 7), commonly affects, also, the high-bush whortleberry. The gray form of the moth is most frequent in autumn.

GELECHIA GALLESOLIDAGINIS, N. Sp.—Larra.—Length 0.60 [inch, = 15^{mm}]. Cylindrical. Color dark dull-brown, without shine. Largest on middle segments; tapering from 4th to head, and from 9th to extremity. Each segment impressed transversely in the middle, thus forming two folds, the thoracic segment having other such folds. Six small piliferous spots, two each side of dorsum and one above stigmata, which, together with the stigmata, are shiny and of a lighter brown than the body. Head and cervical shield light shiny-brown.

Chrysalis.—Length 0.50 [inch, = 12.5mm]. Mahogany-brown. Form normal. Blunt

at extremity.

Perfect moth.—Average length 0.38 [= 9.5 mm]. Alar expanse \$\times 0.95 \text{ [inch, = 24 mm], } \$\text{ 0.75 [inch, = 18.8 mm].}\$ Fore wings deep purplish-brown, more or less sprinkled with carneous. A light carneous band starts from the costa near the base, and curves towards the middle of the inner margin, which it occupies to a little beyond the beginning of the cilia, where it curves upwards towards the tip, reaching only half way up the wing. Here it is approached from above by a somewhat diffuse spot of the same color, which starts from the costa just behind the apex, and runs down to the middle of the wing.

In the plainly marked individuals there is an extra line running from the middle of the inner margin, outwardly obliquing to the middle of the wing, and then back to the inner margin a little beyond where the cilia commences, but in the great majority of specimens this mark is indistinct. Cilia light carneous. Hind wings slate-gray, with the cilia lighter. Antenna finely annulated with the same two dark and light colors. Head, thorax and palpi light, with a sprinkling of the dark brown. Body dark, with light annulations. The species varies in the distinctness of its markings, and the light parts of the front wing appear finely sprinkled with brown under the lens. Male generally smaller than female, with the antenna proportionately a little longer.

Described from numerous bred specimens.

It seems to resemble *G. longifasciella* of Clemens, in coloration and pattern; but unfortunately our late lamented microlepidopterist, failed almost always to give the measurement of the species he described, and it is impossible to tell how much mine resembles that species. Yet, as *longifasciella* was described from two mutilated specimens, received from A. S. Packard, jr., and as that gentleman has seen my insect and declared it an undescribed species, there can be little doubt of the fact.—[First Rept., p. 175. Pl. II, Figs. 1, 2, 5.

Pterophorus Cardui, N. Sp.—Larva.—Average length 0.60. Largest in the middle of body, tapering thence each way. Color light straw-yellow—greener when young. Somewhat darker, partly translucent, dorsal, subdorsal and stigmatal lines. Two lateral rows of black spots, the lower spots rather smaller and placed behind the

upper ones. A third row above these, and others along the back, but so small that they are generally imperceptible with the naked eye, except on the thoracic segments, being especially distinct on segment 2. Head small, black, sometimes inclining to brown. Cervical shield black, divided longitudinally in the middle by a lighter line. Caudal plate also black. Segment 11, besides the spots above mentioned, has two transverse black marks, the posterior one the largest. Thoracic legs black, the others of the same color as the body.

Described from 12 specimens.

Pupa.—Average length 0.45. Of form of Plate 2, Fig. 14. Soft, dull yellow, with a lateral dusky line each side of dorsum, and another, less distinct, each side of venter. Also dusky about the head and wing-sheaths.

Perfect insect.—Length 0.45; alar expanse 0.80. Front wings bifid, the cleft reaching not much more than 1 of wing; tawny yellow, with a distinct dark brown triangular spot running from costa to the base of eleft—sometimes a little below it—its posterior margin with a slight concave curve. Three dusky, diffuse longitudinal spots, one placed on the basal third of the wing at costa and frequently reaching along the costa to the triangular spot; one near the interior margin, a little nearer to the base of wing than the last, and one on the outer third of the interior margin. Two light-colored transverse lines across the end of wing, one very near and parallel with posterior margin, the other bordering the triangular spot behind, and curving across the lower lobe towards posterior angle. The space between these two light lines usually darker than the ground-color. Fringes dark with a light margin. Hind wings trifid, the upper cleft reaching a little beyond the middle, the lower one to the base of wing. Color ashy-brown, the lower lobe produced into a dark angular spot about their middle postcriorly. Antenna, palpi, head, thorax, and body, tawny yellow; legs of the same color with the exception of the tarsi, which are almost white, with alternate dark brown spots, the spines being black, with dusky tips.—[First Rept., pp. 180-181. Fig. 98, and Pl. II, Figs. 13, 14.

Zeller has since (1872) referred it to the genus *Platyptilia* (Beitr. zur Kenntn. N. A. Nachtfalter, 2nd part, p. 118), and indicates the difference between it and a very closely allied European species, *P. Zetterstedtii*. He very properly, because of the incongruous compound, drops the conventional ending *dactylus* which I used in the original description.

HETEROPTERA.

NYSIUS DESTRUCTOR, N. Sp.—General color grayish-brown; of shape of N. thymi Wolff. Head either minutely or more coarsely punctate, and more or less distinctly pubescent; the surface usually brown, with a distinct black, longitudinal line each side, broadening on the crown, but generally leaving the orbit of the eyes pale; these lines sometimes more diffuse and occupying the whole surface, except a median brown spot at base of erown, and a narrow, paler spot on the clypeus; oeelli piceous; eyes opaque, either black or slate-color; face sometimes uniformly pubescent and appearing dark grayish-brown; but more generally black each side of rostrum, with a distinct yellowish-brown spot on the cheeks below the eyes; rostrum piceous, paler at base and reaching to hind eoxæ; antennæ either pale yellowish-brown or darker brown, the torulus and first joint darkest. Thorax, pronotum narrowing anteriorly, the sides slightly sinuate, irregularly and more coarsely punctate than the head, more or less pubescent, dingy yellow or brown, with a transverse black band near the anterior edge, obscuring the incision and leaving the edge pale, especially in the middle, where there is often a conspicuous pale spot; also five more or less distinct longitudinal dark lines, the central one most persistent and leading on the posterior margin to a pale, shiny, impunctate spot; the callus at hind angles, and sometimes an intermediate spot between it and the median one, and the entire posterior margin, also pale and impunctate; scutellum dark, coarsely punctate, sometimes with a smooth median longitudinal ridge ending in a pale spot, and with the lateral margins pale; prosternum dark, more or less pubescent, the anterior and posterior margins, and a band outside of coxie, more or less broadly pale; mesosternum and metasternum also dark, with the pale spots outside of coxe. Legs pale yellow, inclining more or less to brown; coxe dark at base, pale at tip; trochanters pale; front and middle femora spotted more or less confluently on the outside with brown; hind femora, & dark brown, except at tips and base; 9 spotted only; tibiæ ringed with brown at base; tarsi marked more or less with brown, especially at tip. Hemelytra either colorless, transparent and prismatic, or distinctly tinged with dingy yellow; shallowly punctate and very finely pubescent, the veins of corium and clavus dingy yellow, with brown streaks, the more constant of these streaks being two on posterior margin of corium, and one at the tip of clavus. Abdomen, & tergum piceous, with the sutures and sides of some of the joints rarely paler; venter piceous, minutely and regularly covered with gray pubescence: Q sutures and spots on tergum more often pale; venter dingy yellow, except at base; Q paler than &, and generally larger. Average length 0.13 inch [=3.1mm].

Larra.—Dingy yellow, with more or less distinct longitudinal dark lines, especially on head.

Pupa.—Same color, with more distinct red and brown longitudinal lines, and two little tooth-like, pale yellow processes at inner base of hemelytra pads, indicating the wings; the abdomen paler than the rest of the body.

Described from numerous specimeus. I have some, especially males, in which the black so predominates that the paler parts of the head and thorax are scarcely traceable, while in others again the pale parts predominate almost to the exclusion of the black. Indeed, so variable is the species that it is difficult to see wherein some of the specimens differ from the European thymi, or from N. angustatus Uhler, and it is barely possible that future comparison will show specific identity between some or all of the three. But as long as authors fail to give the variation a species is liable to, or the number of specimens a description is drawn up from, it will remain impossible to decide such questions satisfactorily, and I name destructor at the suggestion of our Hemipterist, Mr. P. R. Uhler, of Baltimore, who has examined specimens which I sent him.—[Fifth Rept., p. 113. Fig. 41.

Mythaspis pomicorticis, N. Sp.—Eggs—from 30 to 100 under each scale; length scarcely 0.01 inch, irregularly ovoid, nearly thrice as long as wide, snow-white, except just prior to hatching, when they become yellowish. Larva—Length of body 0.01 inch, ovoid, thrice as long as wide, pale yellow, with a darker yellow spot near each end; a few short hairs seen around border; two fine anal setæ about half as long as body springing from two lobes between which two spinous hairs are always seen; antennæ quite variable, the joints irregular and not easily resolved, sometimes appearing only 6-jointed, but more generally 7-jointed, with a few hairs, two or three at tip the longest and most persistent; legs with a one-jointed tarsus, a feeble claw, and, among other hairs, four more or less distinctly knobbed ones near tip, the two uppermost longest.

&—Length of body, 0.022 inch [= .5.5^{mm}]; color, translucent carneous-gray; a dorsal transverse band on each abdominal joint, and portions of the mesothorax and metathorax darker, or purple-gray; the members somewhat lighter. Head, sub-triangular; rostrum rudimentary; ocular tubercles, one each side of it, plainly visible, the eyes on the upper surface prominent, dark, and with few facets; antenna as long as body, 10-jointed, joints 1 and 2 bulbous and sometimes indistinctly separated; 3—9 about four times as long as wide, slightly constricted; 10 half as long and fusiform; all but basal two with a whorl of about eight hairs, slightly clavate and as long as width of joint. Thorax very large, oval; prothoracic portion narrowing in front, composed of two transverse folds, the anterior one having a transverse row of four dusky dots; the mesothoracic portion large and elevated, showing three lateral swellings; a well-defined medio-dorsal plate, rounded in front, shallowly-notched behind, with a medio-

longitudinal suture, and a transverse one dividing it in two, the anterior half pale the posterior darker; the metathoracic portion showing a sub-triangular scutel, and separated from mesothorax by the transverse band (apodema of Targioni). Wings about as long as body, arising from base of mesothorax, spatulate, closing flat on back in repose, and appearing whitish, finely and uniformly covered with short, stiff hairs; supported by a bifurcate vein, the bifurcation arising from basal fourth, and each fork running near and almost parallel with the wing-margius; balancers dark, with the hook quite long. Legs with the middle pair longest, and—from large size of coxe -further from front than from hind pair; the coxe and femora large and swollen, the latter with a more or less distinct lobe near the base below; the tarsi one-jointed, with a constriction occasionally indicated, and terminating in a single flexible claw, surrounded by four clubbed hairs; the tibia and tarsi are quite bristly, but on the femora there are usually but two bristles, one about the middle above, and one on the basal lobe below; the coxe also have one above. Abdomen, seen from above, nearly as long as thorax; appearing shorter from below; 8 joints only discerned; the last joint abruptly narrowed into a large tubercle bearing four bristles on the under side, and sending forth the genital armor in the form of an awl-shaped style as long as the abdomeu.

& Scale—Larval part golden yellow; the aual shield yellowish-brown, sometimes quite pale, inclining to white, flattened, straight, rather more than twice the length of larval scale, increasing in width from tip to end, where it is slightly truncate; attached by a white film; average length, 0.035 inch.

Q—Average length, 0.05 inch: color, pale yellow; jug-shaped and flattened when young, more globular when mature, and twice as long as wide; the cephalo-thoracic portion rounded and entire, but narrower than the abdominal, at the juncture with which it forms a more or less conspicuous lateral projection; on its inferior side is a tubercle, having two longitudinal ridges, and giving rise to a corneous, filiform proboscis, longer than the body, and composed of four separate parts; posterior abdominal joints deeply lobed laterally, with two or three blunt, fleshy hairs to each lobe; anal plate gamboge-yellow, corneous, with an irregular border, presenting two larger, slightly tri-lobed, median projections, and one or more smaller ones each side, furnished with spinous hairs, two especially between the tri-lobed projections aforenamed; five more or less complete sets of secretors visible from below, arranged around anus in form of an arc, the median set with normally 10, the upper laterals 20, and the lower laterals 14; besides these, some six or more blunt tubes, and a series of shorter pointed ones, may be noticed along the border, and doubtless serve as secretors. (See Fig. 32 b.)

♀ Scale—Larval scale golden-yellow; median scale somewhat darker; anal shield varying from pale brown to deep purplish-gray, and generally of a color with the bark it is upon. The whole scale is often incanous, but the hoary film easily rubs off; it averages 0.12 inch in length, but is quite variable in form and size, being either straight or curved, narrow and strongly arched, or broad and flatter, but always rounded at the end; the white inferior lamina at sides sometimes show distinctly from above, and give the appearance of a pale border.

The lice, whether \mathfrak{z} or \mathfrak{Q} , vary in appearance according to position and state of maturity. In making the foregoing descriptions and figures, I have taken what appeared the most natural positions, after examination of many specimens. The \mathfrak{z} abdomen shrinks very much in drying, and the more detailed \mathfrak{Q} characters are variable. While the normal number of secretors in the middle set is never more than 10, I have sometimes found but 8 or 9; that of the upper laterals never surpasses 20, but may be as low as 15; while that of the lower laterals is more uniformly 14, though I have sometimes found 16, and at others 12. Opposite sets do not always contain the same number.—[Fifth Rept., pp. 95–96. Figs. 31, 32.

This is the species previously known as Aspidiotus conchiformis, or popularly as the Oyster-shell Bark-louse, and the reasons for separating it are given in the report.

ERIOSOMA ULMI, N. Sp.—Color dark blue. Length to tip of closed wings, exclusive of antennæ, 0.12 [inch, =3mm]. Wings hyaline, three times as long as wide, and more pointed at the ends than in *E. pyri*. Costal and subcostal veins, and that bounding the stigma behind, robust and black. Discoidal veins together with the 3d forked and stigmal veins, all slender and black, the forked vein being as distinct to its base as are the others, with the fork but \(\frac{1}{3}\) as long as the vein itself and curved in an opposite direction to the stigmal vein. Antennæ 6-jointed and of the same color as the body; joints 1, 2, 4, 5 and 6 of about equal length, joint 3 thrice as long as either. Legs of the same color as body.

The young lice are narrower and usually lighter colored than the mature individuals, varying from flesh or pink to various shades of blue and purple.—[First Rept., p. 124.

Professor Thomas (Trans. Ill. St. Hort. Soc., 1876, p. 191) has called it *Erisoma Rileyi** because of *ulmi* being preoccupied by an European species. It belongs to *Schizoneura*. For subsequent remarks see "Notes on the Aphididæ of the United States, etc., by C. V. Riley & J. Monell," (Bull. Hayden's U. S. Geol. & Geogr. Survey, Vol. V, No. 1, p. 3.)

DIPTERA.

ASILUS MISSOURIENSIS N. Sp.—Alar expanse 1.85 [inches, = 47 mm]; length of body 1.30 inches [=33mm]. Wings transparent, with a smoky yellow tinge, more distinct around the veins, which are brown. Head pale yellow, sometimes brownish; moustache straw-yellow with a few stiff black hairs below; beard pale straw-yellow; crown very deeply excavated; base of the same pale yellow with short, stiff, yellowish hairs, and a crown of black ones near the border; eyes large, prominent, finely reticulated and almost black: antenna, first joint black tipped with brown, cylindrical and hairy; second joint black, short, thick and rounded at tip, with a few stiff hairs; third joint as long as first, tapering each way, smooth, black and terminating in a long, brown bristle; proboscis black and nearly as long as face; neck with pale and black hairs. Thorax leaden-black, slightly opalescent with reddish brown at sides, more or less pubescent with pale yellow, especially laterally and posteriorly and in three narrow longitudinal dorsal lines which gradually approach towards metathorax; bearded at sides and behind with a few deenryed black bristles, those behind interspersed with a few smaller pale hairs; scutel of the same color, with upwardenrying, black bristles; halteres brown. Abdomen, &, general color dull leaden-yellow, with darker transverse bands at insections; the light color produced by a yellowish pubescence and numerous short close-lying yellow hairs, the dark bands produced by the absence of this covering at the borders of each segment; basal segment broad, bilobed, and with lateral black bristles; segments 6, 7, 8 and anal valves with a decided pink tint, especially 7; 8 but one-third as long as 7 above. 2, broader, flatter, more polished and brassy, with no transverse darker bands, segments 7 and 8 polished black, the latter narrow and longer than any of the others; anus with a few black bristles. Legs, dull purple-brown, with black bristles; thighs very stout, the hind pair rather darker than the others, the two front pair of trochanters with long, yellowish hairs; pulvilli, generally fulvous.

Described from two \mathcal{J} , and two \mathcal{Q} , all captured while sneking honey bees. I have not access to Loew's descriptions, and cannot therefore compare it with already described species; but specimens have been sent to Dr. Wm. LeBaron, of Geneva, Illinois, and to Baron Osten Sacken, of New York, and both these gentlemen are unacquainted with it, and believe it to be new. In the well marked \mathcal{J} specimens, the body bears a general resemblance to that of *Trupanea* [*Promachus*] *vertebrata*, Say.—[Second Rept., pp. 122-123. Fig. 89.

^{*} By typographical error Rilepi.

Baron Osten Sacken has since placed this as a synonym of *Procta*canthus Milbertii Macq. in the second edition of his Catalogue of the described Diptera of North America (1878), p. 81.

Lydella doryphor.e, New Species.—Length 0.25 [=6^{mm}]. Alar expense 0.48 [=12^{mm}]. Antennæ black. Palpi fulvous. Face silvery white. Front silvery, tinted with pale golden-brown, with a broad middle stripe black. Thorax cinereous with imperfect black stripes. Abdomen black and silvery-ash, changing into each other when viewed from different angles. When viewed from above: first segment deep black with a posterior border of silver-ash very narrow in the middle, much widened laterally, but abbreviated at the sides of the abdomen. The other segments with the basal half silvery-ash, terminal half black. Legs black. Fourth longitudinal vein of the wings straight after the angle. Posterior transverse vein arcuate.

Described from numerous bred specimens.—[First Rept., pp. 111-112. Fig. 48.

This species is referred by Osten Sacken to the genus *Exorista* of Schiner, *Lydella* not being received as a distinct genus. The name *Lydella* is used also for a genus of Acarina.

Exorista Flavicauda, N. Sp.—Length 0.35 to 0.50 inch [=8.5-12.5mm]. Head broader than thorax: face, silvery-white, the cheeks inclining to yellow, with lateral black hairs extending to near the base of antennie, and one stiffer and longer bristle at top of cheeks; front, dusky, ferrugizous, with two rows of black converging bristles; divided by a broad depressed stripe of a brighter ferruginous color and without bristles; occiput bright ferruginous; labium ferruginous with hairs of same color; maxipalps rufous; eyes dark mahogany-brown, and perfectly smooth; antennie, two basal joints rufous, with black hairs, third joint flattened, dusky, and thrice as long as second; seta, black; entire hinder part of head covered with dense white hairs. Thorax, more decidedly blue than in leucania, broader (instead of narrower) in front than behind; the vittæ less distinct; scutel of same color as thorax. Abdomen, stout and more cylindrical than in leucania; first joint dark bluish-gray; second, light bluish-gray, becoming darker along the middle, at sides and at lower border; third joint, like second above, but golden-gray at sides (no rufous); last joint entirely vellow or pale orange, with no other color and but few black bristles around anus. Wings more dusky than in leucaniæ; alulæ, opaque bluish-white. Legs, black; pulvilli pale yellow.

Described from one captured, 4 bred \(\varphi\). Space between eyes at occiput fully one-third the width of head.—[Second Rept., pp. 51-52. Fig. 18.

Tachina [Exorista] phycitæ, LeBaron—Imago.—Length, 0.20 inch [=5^{mm}]. Antennæ black, third joint twice as long as the second; face silvery, without bristles at the sides; sides of the front silvery at the lower part, pale golden above; the middle black vitta occupying a little more than half of the width of the inter-ocular space; frontal bristles continued down the face to opposite the end of the second joint of antennæ; palpi blackish-brown; eyes hairy. Thorax black, with the ordinary einereous stripes scarcely perceptible. Abdomen black, varied with cinereous at the base of the segments; a large fulvous spot on the side of the abdomen occupying nearly the whole of the side of the second segment, half or more of the third, and sometimes a small spot on the first; bristles on the middle as well as at the hind-margin of the second and third segments. Venation of the wings of the usual type; first posterior cell almost closed, before the end of wing; fourth long vein slightly curved after the angle; fifth long vein prolonged to the margin; hind cross vein moderately sinuous. Tarsal claws and pulvilli unusually long.

Female? A single specimen, a very little larger than the others, was obtained from the same lot of leaf-crumplers, which possibly may be the Q of the same species. It differs as follows: Front broader; antennæ dark brown; the cinereous markings of the body more distinct; the tip of abdomen fulvous, but without the fulvous spot at the sides; and with the tarsal claws of ordinary length.

This species appears to belong to the subgenus *Exorista* of Meigen, closely allied to *Tachina* proper, and differing from it chiefly in having the cyes hairy, and in the presence of bristles on the middle, as well as at the hind margin of the second and third abdominal segments, whereas *Tachina* has only the latter.—[Fourth Rept., p. 40-41.

This species was simultaneously published by Dr. LeBaron in his 2d Rept. Ins. Ill., p. 123. It is retained in *Exorista* by Osten Sacken.

Anthomyia zeae \mathfrak{P} , N. Sp. (Pl. 2, Fig. 24). Length 0.20 [inch, $=5^{\mathrm{mm}}$]; alar expanse 0.38 [inch, $=9.5^{\mathrm{mm}}$]. Antenne black; style microscopically pubescent; front, fulvous, with a distinct, rather narrow, brownish, cinereous margin; face and orbits brownish-white; palpi and proboseis black; ocellar area somewhat heart-shaped; thorax and abdomen pale yellow-brownish cinereous, with minute black points at the insertion of the bristles; thorax with an indistinct middle stripe of brown; legs black, tinted with cinereous; poisers pale ochre-yellow; scales small, the upper valve larger than the lower.—[First Rept., p. 155. Figs. 86, 87, and Pl. II, Fig. 24.

Anthomyla radicum (Linn.) var. calopteni—Egg—Oval, smooth, white, 0.04 inch long.

Larva—Skin unarmed, 0.24 inch [= 6^{mm}] long when extended, of the normal form, the mandibular hooks black, quite conspicuous, and diverging at base. Prothoracic spiracles elongate. Anal spiracles minute, yellowish-brown, with the 8 fleshy surrounding tubercles, small.

Pupa—Pale-brown, rounded at each end, with the prothoracic spiracles and lips anteriorly, and the anal spiracles and lower tubercles posteriorly, showing as minute points.

Imago—Q. Average expanse 0.48 inch [=12mm]. General color ash-gray with a ferruginous hue, especially above, and a more or less intense metallic reflection. Face with white reflections below; eyes smooth, brown, encircled by the ground color, and this behind and on forehead bordered by a brown line; 2 similar lines at back of head from upper corners of eyes and approaching to neck; forehead dusky-brown, becoming bright yellowish-red toward base of antennæ, and the brown forking at right angles around occiput. Trophi and antennæ black, the style simple and somewhat longer than the whole antennæ. Thorax with three dusky longitudinal lines, obsolete behind; legs black, with cinereous hne beneath; wings faintly smoky, with brown-black veins, the discal cross-vein straight and transverse, the outer one bent and more oblique; balancers crumpled, yellowish. Abdomen with faint dusty mediodorsal spots, broad at base, tapering and obsolescing toward end of each joint.

In the 3, aside from the larger eyes, stronger bristles, and narrower, less tapering abdomen with its additional joint—all characteristic of the sex—the face is whiter, and the medio-dorsal dark mark of abdomen continuous.

Described from 25 specimens of both sexes, reared from locust-egg-feeding larvæ.

Specimens bred from cabbage and radish roots, and others in my cabinet taken from the burrows (made in Osage Orange in Missouri) of *Crabro stirpicola* Pack.; do not differ specifically.—[Ninth Rept., p. 95.

For further details see First Rept. of the Commission (pp. 285-9), where the species is shown to be the *Anthomyia angustifrons* of Meigen.

ORTHOPTERA.

CALOPTENUS ATLANIS N. sp.—Length to tip of abdomen 0.70—0.85 inch [=17.5—21^{mm}]; to tip of closed wings 0.92—1.05 inches [=23—26^{mm}]. At once distinguished from femur-rubrum by the notched character of the anal abdominal joint in the male and by the shorter, less tapering cerci; also by the greater relative length of wings which extend, on an average, nearly one-third their length beyond the tip of the abdomen in the dried specimens: also by the larger and more distinct spot on the wings—in all which characters it much more closely resembles spretus than femur-rubrum.

From spretus, again, it is at once distinguished by the smaller size, the more distinct separation of the dark mark running from the eyes on the prothorax and of the pale line from base of wings to hind thigh; also by the anal joint in the 3, tapering more suddenly and by the two lobes forming the notch being less marked. From both species it is distinguished not only by its smaller size but by the deeper, more livid color of the dark parts, and the paler yellow of the light parts—the colors thus more strongly contrasting.

63's, 97's from New Hampshire. Just as the typical femur-rubrum is at once distinguished from the typical spretus by the characters indicated; so Atlanis, though structurally nearer to spretus, is distinguished from it at a glance by its much smaller size and darker, more marbled coloring. The contrast is all the greater in the living specimens, and I have seen no specimens of spretus that at all approach it in these respects.

Whether this is the femur-rubrum as defined by DeGeer or by Harris, it is almost impossible to decide, though Harris's figure of femur-rubrum better represents it than the true femur-rubrum, as subsequently defined by Thomas, and as found in Illinois and Missouri.—[Seventh Rept., pp. 169-170.

For further details and structural differences between it and *C. spretus* see First Report of the Commission.

LIST OF DESCRIPTIONS OF ADOLES-CENT STATES.

In making out the following list of descriptions of adolescent states, etc., that appeared in the Reports, the nomenclature there used is retained. Unless otherwise stated the insects, in the particular states indicated, were at the time unknown or undescribed, the descriptions first appearing in the Reports. Those published in connection with the preceding descriptions of new species are omitted here:

HYMENOPTERA.

Nematus ventricosus; larva: IX, 21. (Previously described by several writers.)

Pristiphora grossularia; larra: IX, 26. (Description quoted from Walsh.)

Emphytus maculatus; larva and pupa: IX, 28-29. (Previously described by me in the Prairie Farmer, May 25, 1867.)

Lophyrus abbotii; larva: IX, 32.

Lophyrus lecontei; larra: IX, 33. (This and abbotii both partially described by me in the Prairie Farmer, November 10, 1866; May 25, 1867; May 2, 1868, and in the Prairie Farmer Annual, 1869.)

Tiphia inornata; larva: VI, 126.

COLEOPTERA.

Harpalus (probably herbivagus Say); larva: IX, 97.

Harpalid; larva; I, 59.

Mysia 15-punctata; larva: IV, 18.

Chilocorus bivulnerus; larra and pupa: I, 16.

Hippodamia convergens; larra and pupa: I, 112. (Previously mentioned in the Am. Ent. I, 46, and elsewhere.)

Coccinella picta; larva: V, 101.

Passalus cornutus; larva and pupa: IV, 140-141. (Previously mentioned by Burmeister and by Walsh.); egg: V, 55.

LACHNOSTERNA QUERCINA; egg: V, 55.

Pelidnota punctata; larva and pupa: III, 78-79. (First described by me in Am. Ent. II, 295.)

Telephorus bilineatus; larva: IV, 30. (First described by Packard.)

Chauliognathus pensylvanicus: larva: I, 57. (Quoted from the Am. Ent. I, 35.)

Chrysobothris femorata; eggs: VII, 73: larva, I, 46. (Previously described by Fitch and others); eggs, larva, and pupa: VII, 73.

Sinoxylon basilare; larva and pupa: IV, 54.

Corynetes rufipes; larva and pupa: VI, 101, 102.

Prionus laticollis; larva: I, 126; larva and pupa: II, 87; egg: V, 56. laticollis.)

Saperda bivittata; pupa: I, 43. (Previously described by Harris.)

Lema trilineata; larva and pupa: I, 99. (From the Prairie Farmer; and the Am. Ent. I, 26. Previously described by Harris and others.)

Doryphora juncta; larva: I, 106. (First described in the Am. Ent. I, 43.)

Doryphora 10-lineata; eggs and larva: I, 105. (From the Am. Ent. I, 43. Previously described by me in Prairie Farmer Aug. 8, 1863.

91

Colaspis flavida; larva: III, 84, and IV, 34.

Coscinoptera dominicana: eggs and larva: VI, 128, 130.

Haltica chalybea; larra and pupa: III, 81. (Quoted from Am. Ent. II, 327. The larva first described by Packard, Guide, p. 507.)

Blepharida rhois; egg, larva and pupa: VI, 121.

Cassida bivittata; lurca and pupa: II, 61. (First described by me in the Prabile Farmer Annual for 1868, p. 53.)

Cassida aurichalcea; egg: II, 60; larva and pupa: II, 62. (Previously described by Harris.)

Cassida pallida; larva: II, 62.

Cassida guttata; larra and pupa: 11, 63.

Cassida nigripes; larva and pupa: II, 63, 64.

Bruchns pisi; egg: III, 47.

Tenebrionid ?; larva: VI, 113. (Previously described as the larva of Eupsalis by Harris.)

Eupsalis minuta; larra and pupa: VI, 115, 116. (The pupa first described by Harris.)

Conotrachelus cratægi; larva and pupa: III, 39.

Baridius trinotatus; larva and pupa: I, 95. (From the Am. Ent. I, 22.)

Anthonomus quadrigibbus; egg: III, 31; larva and pupa: III, 35.

LEPIDOPTERA.

Papilio philenor; larva and pupa: II, 117. (Previously described by Smith and Abbot, and by Boisduval and Le Coute; also by Harris in Ent. Corr.)

Pieris protodice; larva and pupa: II, 104. (Published simultaneously in the Am. Ent. II, 77.)

Pieris rapæ: larva and pupa: II, 108. (Previously described by various authors.)

Danais archippus; egg: III, 144.

Limenitis disippus; egg and larva: III, 154. (The mature larva previously described by various authors.)

Apatura lycaon; egg, larva and pupa: VI, 146, 147. (The larva and pupa badly described by Boisd. & Lec.)

Apatura herse; egg, larva and pupa: VI, 148. (The larva and pupa badly described by Boisd. & Lec.)

Paphia glycerium; larva and pupa: II, 127. (First published by me in Am. Ent. II, 123); egg and larval changes: V, 146.

Megathymus yucce; egg, larva and larval changes: VIII, 174, 181. (First published by me in Trans. St. Louis Ac.); IX, 129.

Cheerocampa pampinatrix; egg, larra and pupa: II, 71, 72. (Previously described, except egg, by various authors.)

Philampelus achemon; young and full grown larvæ and pupa: II, 74, 75. (Previously described by various authors.)

Philampelus satellitia; eggs, young and full grown larva, and pupa: II, 76-78. (Previously described, except egg, by various authors.)

Sphinx 5-maculata; larra pupa: I, 95. (From the Am. Ent. I, 23; previously described by several anthors.)

Thyreus Abbotii; larva and pupa: II, 78, 79. (Previously described by various authors.)

Deilephila lineata; two forms of larva: III, 141, 142. (Previously described, but not in connection. Quoted from the Am. Ent., II, 258.)

Ægeria acerni; larva and pupa: VI, 110.

Ægeria rubi; larra: VI, 113.

Psychomorpha epimenis; larra and pupa: III, 64, 65; VI, 88. (First described as the possible larva and pupa of Eud. nnio, Am. Ent. II, 152 and in 1st Rept., p. 84.)

Endryas grata; eggs, larra and pupa: II, 83; VI, 89, 90. (The larva previously described by Harris and others.)

Eudryas unio; larva and pupa: VI, 92. (First described by Lintner.)

Alypia octomaculata; larva: I, 136, (previously mentioned by Fitch); II, 80, published simultaneously in the Am. Ent., II, 151, (previously described in Harris' Corr.); VI. 94.

Procris americana; larva and pupa: II, 86. (First described by Harris.)

Callimorpha fulvicosta: larra: III, 134.

Spilosoma virginica; larvo and pupa: III, 69. (Previously described by various authors.)

Hyphantria textor; larva: III, 132. (First described by Harris.)

Ecpantheria scribonia; larva: IV, 143. (Previously described by other authors.)

Bombyx mori; egg and larra: IV, 86. (Previously well known.)

Attachs cecropia; larral changes: IV, 106. (Quoted from the Am. Ent. II, 100.)

Attachs cynthia; larval changes: IV, 117. (Previously described by other authors.)

Attacus promethea; lurval changes: IV, 121. (Partially given by other authors previously.)

Attachs luna; larval changes: IV, 124. (Previously given by Lintner.)

Attachs polyphemus; larval changes: IV, 126.

Attachs yama-maï; larral changes: IV, 132. (Previously described by other authors.)

Attacus pernyi; egg, larra, and cocoon: IV, 137. (Previously described by other authors)

Hemileuca maia; egg and larcal changes: V, 128, 129. (Previously described by Lintner.)

Hyperchiria io; larval changes: V, 135. (Previously given by Lintner.)

Anisota rubicunda; eggs and larval changes: V. 138.

Acronycta oblinita; larra and pnpa: III, 71. (The larva first figured by Smith & Abb.)
Acronycta xylinoides; larva: V, 126.

Amphipyra pyramidoides; larva and pupa: III, 73, 74.

Leucania unipuncta; larva and pupa: II, 49: VIII, 33, and larva: II, 55 (previously described by various authors); egg: VIII, 34: egg and larval changes: VIII, 184, 185.

Gortyna nitela; larra: I, 92. (From the Am. Ent., II, 22. Briefly described by Harris, Treatise, p. 440; but first identified by me in the Prairie Farmer.)

Agrotis inermis; larra and pupa: I, 74.

Agrotis cochranii; larra and pupa: I, 76. (First described by me in the Prairie Former, June 22, 1867.)

Agrotis clandestina; larva and pnpa: I, 79. (Previously mentioned by Harris.)

Agrotis telifera; larva and pnpa: I, 81. (Described by me in the Prairie Farmer, June 22, 1867; and previously described in Europe, where the species also occurs and is known as A. upsilon.)

Agrotis subgothica; larva: I, 82.

Agrotis jaculifera; larva and pupa: I, 83.

Agrotis devastator; larro and pupa: I, 84.

Hadena subjuncta; larra and pupa: I, 85.

Celæna renigera; larva and pupa: I, 86.

Prodenia commelinæ; larra: I, 88; III, 114 (from Am. Ent., II, 363). [See Notes.]

Anisopteryx vernata; larra and pupa: II, 95-97 (previously described by other authors); eggs, larra and pupa: VII, 82 (and 86-87, adapted from Mann); Paleacrita vernata, VIII, 13-17 (from the Trans. St. Louis Acad.)

Anisopteryx pometaria; cygs: II, 94-95 (the two species confounded); eggs, larva and pupa: VII, 84 (and 86-87, adapted from Maun); VIII, 13-17 (from the Trans. St. Louis. Acad.)

Eufitchia ribearia; egg, lorva and pnpa': IX, 3, 4. (The larva first described by Fitch.) Phacellura nitidalis; larva: II, 67.

Asopia costalis; larra and pnpa: VI, 106. (The larva mentioned by Harris, but first described by Walsh in the Proc. Ent., and first bred and determined by me, Prairie Farmer, April 20, 1867.)

Phycita nebulo: larva and pupa: IV, 41. (The larva first described by LeBaron.)

Pempelia grossularia; larva and pupa: I, I41. (Larva previously described by Fitch and by Packard.)

Tortrix rileyana; larra and pupa: I, 154.

Anchylopera fragariæ; larva: I, 143. (First described in the Am. Ent., I, 90.)

Penthina vitivorana: larva and papa: I, 135. (The larva first described, but not identified, by Rathyon.)

Carpocapsa pomonella; larva and papa: I, 63. (Previously described by various anthors.)

Walshia amorphella; larra and pupa: II, 133.

Bucculatrix pomifoliella; larca and pupa: IV, 51. (Larva previously described by Clemens.)

Œta compta; larva and pupa: I, 152.

Pterophorus periscelidactylus; larva and pupa: I, 137; III, 66. (Previously described by Fitch.)

Pterophorus carduidactylus; larva and pupa; I, 180.

Pronuba yuccasella; larva: V, 155; pupa, VI, 131 (from Trans. St. Louis Acad.); egg, VI, 133 (from Am. Nat.).

Orgyia lencostigma; eggs, larva and pupa: I, 144-146. (Previously described by others.)

Thyridopteryx ephemeraeformis; eggs, larva and pupa: I. 148, 149. (Previously described by others.)

Hæmatopis grataria; eggs, larva and pupa: I, 179.

Galleria cereana; larva and pupa: I, 166. (Previously described by other authors.)

HEMIPTERA.

Strachia histriouica; eggs, larva and pupa: IV, 37.

Micropus leucopterus; egg, larval stages and pupa: VII. 21.

Cicada septemdecim; egg and young larva: I, 25. (The eggs previously described by several writers.)

Pœciloptera pruinosa; eggs: V, 122.

Ceresa bubalus; eggs: V, 121.

Mytilaspis pinifolia; eggs and larva: V, 98. (First mentioned by LeBaron.)

. Phylloxera rileyi; larva and pupa: VI, 64, 86; VII, 120.

Phylloxera vastatrix; various forms: VI, 66 (previously described elsewhere and by others); impregnated egg: VIII, 159. (Previously described by me in the Trans. St. Louis Acad. for Oct. 18, 1875, and independently by Balbiani in the Comptes rendus de l' Ac. d. Sc. Paris for Oct. 4, 1875.)

Eriosoma pyri; larva: I, 120. (From the Am. Ent., I, 52; previously described by several authors.)

DIPTERA.

Tabanus atratus: larva and pupa: II, 139, 131. (Previously described, but not specifically identified, by Walsh.)

Erax bastardi; larva and pupa: II, 124.

Bombyliid; larva: IX, 96.

Pipiza radicum; larva and pupa: I, 122. (Quoted from the Am. Eut., I, 84.)

Anthomyia zeæ; larva and puparium: I, 155.

Meromyza americana; larra and pupa: I, 160.

Estrus ovis; larva and puparium: I, 162. (Previously described by other authors.)

ORTHOPTERA.

Mantis carolina; eggs and larva: I, 170-171. (Previously described by several authors.)
Canthus niveus: eggs: V, 120. (Previously described as eggs of Ceresa bubulus by Fitch.)

Orchelimum glaberimum; eggs: V. 123.

Phaneroptera curvicauda; eggs: V, 124, and VI, 165; larva and pupa: VI, 166.

Microcentrus retinervis; eggs: V, 123; VI, 155 (previously described as eggs of Pla-

typhyllum by Harris): larva and pupa: VI, 161.

Phylloptera oblongifolia; eggs: V, 123. (See Microcentrus.)

Platyphyllum concavum; eggs: V, 124; VI, 167.

Caloptenus spretus; eggs and egg-mass: IX, 85, 89; larva and pupa: VII, 129.

NEUROPTERA.

Corydalus cornutus; larva and pupa: V, 143, 144 (Previously described by Haldeman); eggs and egg-mass, and young larva: IX, 127.

LIST OF DESCRIPTIONS, MOSTLY AM-PLIFIED, OF SPECIES NOT NEW.

The following list includes the species, already known, of which a complete redescription of the adult is given in the Reports, either because the original description was in a foreign language, or not easily accessible, or of one sex only, or for other reasons.

HYMENOPTERA.

Tiphia inornata Say: VI, 126.

Cryptus extrematis Cress.: IV, 111.

Pezomachus minimus Walsh: II, 52, (From Walsh.)

Ophion purgatus Say: II, 53.

Mesochorus vitreus Walsh: II, 52. (From Walsh.)

Pimpla annulipes Brullé: V, 49.

Macrocentrus delicatus Cress.: V, 50.

Microgaster militaris Walsh: II, 52. (From Walsh.)

Chalcis mariæ Riley: IV, 110. (From the Am. Ent., II, 101-102.)

Isosoma vitis Saunders: II, 93. (From Saunders.)

Antigaster mirabilis Walsh: VI, 163. (From the Am. Ent., II, 169-170.)

Pristiphora grossulariae Walsh: IX, 26-27. (From the Prac. Ent., I, 123.)

Nematus ventricosus (Klug): IX, 22. (From the Prac. Ent., I, 120-121, and the Am. Ent., II, 16-17.)

Emphytus maculatus Nort.: IX, 28.

Lophyrus LeContei Fitch: IX, 33.

COLEOPTERA.

Doryphora 10-lineata Say, var.: IX, 40.

Sphenophorus zeæ Walsh: III, 59. (From Walsh.)

Scolytus caryæ Riley: V, 107. (Female first described in Prairie Farmer Feb. 2, 1867.) [See Notes.]

LEPIDOPTERA.

Apatura lycaon (Fabr.): VI, 144.

Apatura herse (Fabr.): VI, 144.

Megathymus yuccae (Walk.): VIII, 175-176.

Ægeria polistiformis Harr.: III, 76.

Ægeria acerni Clem.: VI, 110.

Prodenia autumnalis Riley: III, 116-117. (From Am. Ent., II, 365.) [See Notes.]

Leucania unipuncta Haw.: II, 56.

Leucania albilinea Guen.: IX, 56-57.

Acronycta oblinita Sm. & Abb.: III, 71.

Amphipyra pyramidoides Guen.: III, 74.

Celana renigera Steph.: I, 86.

Hadena subjuncta Gr. & Rob.: I, 85.

Noctua claudestina Harr.: I, 79.

Agrotis inermis *Havv.*: I, 74.

Agrotis cochranii Riley: I, 75.

Agrotis telifera Harr.: I, 81.

Agrotis jaculifera Gueu.: I, 83.

Anisopteryx pometaria Havr.: VIII, 15-17. (From the Traus. St. Louis Acad. Sc.)

Paleaerita vernata (Peck): VIII, 15-17. (From the Trans. St. Louis Acad. Sc.)

Asopia eostalis (Fab.): VI, 107.

Pempelia grossulariæ (Pack.): I, 141.

Walshia amorphella Clem.: II, 133.

Penthina vitivorana Pack.: I, 135.

Euryptychia sa igneana Clem.: II, 134. (From Clemens.)

Tortrix rileyana Grote: I, 154.

Walshia amorphella Clem.: II, 133.

Holcocera glandulella Riley: IV, 145. (From the Can. Ent., IV, 18-19.)

Pronuba yuccasella Riley: V, 150, 151, 155; VI, 131-132. (Both from the Trans.

St. Louis Acad. Sc.)

Œta compta Clem.: I, 153.

HEMIPTERA.

Micropus lencopterus (Say); VII, 21, 22.

Mytilaspis pinifoliæ (Fitch): V, 99.

Eriosoma pyri (Fitch): I, 120.

Phylloxera vastatrix *Planchon*: VIII, 159 (From Trans. St. Louis Acad. Sc.); VI, 66-67; VII, 93, 99.

Phylloxera Rileyi *Licht.*: IV, 66; VI, 64, 86; VII, 118-120.

Phylloxera carya-guminosa Riley: VII, 118. (From the Comptes Rendus, Paris Acad. of Sci., Dec. 14, 1874.)

Phylloxera caryæ-ren Riley: VII, 118. (From the Comptes Rendus, Paris Acad. of Sci., Dec. 14, 1874.)

Phylloxera cargae-fallax Riley: VII, 118. (From the Comptes Rendus, Paris Acad. of Sci., Dec. 14, 1874.)

DIPTERA.

Erax bastardi Maca: II. 124.

Pipiza radicum Walsh & Riley: I, 121-122. (From the Am. Ent. I, 83-84.)

Exorista leucaniæ Walsh: II, 51. (From Walsh.)

Tachina bifasciata (Fabr.): V, 140.

ORTHOPTERA.

Caloptenus femur-rubrum (DeG.): VII, 126-128.

Caloptenus atlanis Riley: VIII, 117.

Caloptenus spretus (Thos.): VII; 128-132; VIII, 117.

ACARINA.

Hoplophora aretata Riley: VI, 81. (From Trans. St. Louis Acad., III, 216.)

Tyroglyphus phylloxeræ Riley & Planchon: VI, 81. (From Trans. St. Louis Acad., III, 215.)

7 MO

LIST OF ILLUSTRATIONS.

The illustrations in the Reports were prepared at the author's expense, neither the State nor the Board of Agriculture making any provision therefor. The wood-engraving was done for the most part in St. Louis, by either Wm. Maewitz, Emile Lampe, or Wittemberg & Sorber. Some of it was done by Van Ingen & Snyder, of Philadelphia. A few of the later illustrations are by photo-engraving, and Figs. 50–52 of the 8th Report show the first attempt to combine this process with lithography. In the following list, all drawings were made from nature by the author unless otherwise stated, and when the figure is enlarged the natural size, unless otherwise apparent or stated in this list, will be found indicated in hair-line. The nomenclature of the Reports is retained.

REPORT I.

PLATE I. (Drawn by D. Wiest and lithographed by Bowen & Co., Philadelphia.)

- FIG. 1. Unarmed Rustie (Agrotis inermis Harr.), moth.
- Fig. 2. Variegated Cut-worm (Agrotis inermis Harr.).
- Fig. 3. Variegated Cut-worm (Agrotis inermis Harr.), head, enlarged.
- Fig. 4. Variegated Cut-worm (Agrotis inermis Harr.), one joint, enlarged.
- Fig. 5. Climbing Cut-worm Moth (Agrotis scandens Riley), wings spread.
- Fig. 6. Climbing Cut-worm Moth (Agrotis scandens Riley), wings elosed.
- Fig. 7. Climbing Cut-worm (Agrotis scandens Riley).
- Fig. 8. Lanee Rustic (Agrotis telifera Harr.), moth.
- Fig. 9. Greasy Cut-worm (Agrotis telifera Harr.).
- Fig. 10. Greasy Cut-worm (Agrotis telifera Harr.), head, enlarged.
- Fig. 11. Dart-bearing Rustie (Agrotis jaculifera Guen.), moth.
- Fig. 12. Prodenia commelina, Sm. & Abb., one joint of larva enlarged.
- Fig. 13. Clandestine Owlet Moth (Noctua clandestina Harr.).
- Fig. 14. Subjoined Hadena (Hadena subjuncta Gr. & Rob.), moth.
- Fig. 15. Speckled Cut-worm (Hadena subjuncta Gr. & Rob.), head, enlarged.
- Fig. 16. Speckled Cut-worm (Hadena subjuncta Gr. & Rob.), one joint, enlarged.
- Fig. 17. Speckled Cut-worm (Hadena subjuncta Gr. & Rob.), anal joint, enlarged.
- Fig. 18. Eight-spotted Forester (Alypia octomaculata, Fabr.).
- Fig. 19. Grape-vine Epimenis (Psychomorpha epimenis, Drury), larva. (Mentioned on p. 136, but first named in the 3d Rept., p. 63.)

PLATE II. (Drawn by D. Wiest and lithographed by Bowen & Co., Philadelphia.)

- Fig. 1. Solidago Gall Moth (Gelechia gallasolidaginis Riley), wings expanded.
- Fig. 2. Solidago Gall Moth (Gelechia gallasolidaginis Riley), wings elosed.
- Fig. 3. Walnut Tortrix (Tortrix rileyana Grote), wings expanded.
- Fig. 4. Walnut Tortrix (Tortrix rileyana Grote), wings elosed.

- Fig. 97. Black Breeze-fly (Tabanus atratus Fabr.); a, larva; b, pupa shell; c, fly.
- Fig. 98. False-indigo Gall-moth (Walshia amorphella Clem.); a, moth; b, caterpillar; e, gall; d, section of gall, showing larva in burrow.
- Fig. 99. Misnamed Gall-moth (*Euryptychia saligneana* Clem.); a, moth; b, gall with protruding pupa-shell.

REPORT III.

- Fig. 1. Plum Curculio (Conotrachelus nenuphar, Herbst); a, larva; b, pupa; c, curculio, enlarged; d, punctured plum with curculio resting on it, uatural size.
- Fig. 2. The Hull Curculio-catcher.
- Fig. 3. The Hull Curculio-catcher; viewed from beneath; a, slide for closing central hole, d; b, handles; c, wheels; e, f, position of bag.
- Fig. 4. The Hull Curculio-catcher; viewed from above.
- Fig. 5. Strips of sheeting for closing up the tree-way in Hull's Curculio-catcher.
- Fig. 6. The Hooten Curculio-catcher.

Fig. 7. Sigalphus Curculio-parasite (Sigalphus curculionis Fitch); a, male; b, female; c, antenna.

Fig. 8. Sigalphus Cureulio-parasite (Sigalphus curculionis Fitch); a, larva; b, eocoon; c, pupa.

Fig. 10. Apple Curculio (Authonomus quadrigibbus Say); a, natural size; b, side view; c, back view.

Fig. 11. Apple Carculio (Authonomus quadrigibbus Say); a, pupa; b, larva.

Fig. 12. Quinee Cureulio (Conotrachelus cratægi Walsh.); a, side; b, back.

Fig. 13. Plum Gouger (Anthonomus prunicida Walsh.).

Fig. 14. Strawberry Crown-borer (Analcis fragariæ Riley); a, larva; b, side view of beetle; c, dorsal view.

Fig. 15. Pea-weevil (Bruchus pisi Linn.); a, beetle; b, injured pea.

Fig. 16. Pea-weevil (Bruchus pist Linn.), egg enlarged.

Fig. 17. Pea-weevil (Bruchus pisi Linn.); b, beetle, side view; c, larva; d, pupa, dorsal view; g, pea, infested. [After Curtis.]

Fig. 18. Grain Bruchus (Bruchus granarius Linn.). [After Curtis.]

Fig. 19. American Bean-weevil (Bruchus fabæ Riley); a, beetle; b, bean, infested.

Fig. 20. New York Weevil (*Ithycerus novæboracensis*, Forster); a, exeavation made by female to deposit eggs; b, larva; c, beetle.

Fig. 21. Imbrieated Snout-beetle (Epicarus imbricatus, Say).

Fig. 22. Corn Sphenophorus (Sphenophorus zew Walsh); a, back view; b, outline side view; c, enlarged punctures of elytra.

Fig. 23. Coeklebur Sphenophorus (Sphenophorus pulchellus Scheen.); a, back view; b, outline side view.

Fig. 24. Grape Leaf-folder (*Desmia maculalis* Westw.); 1, eaterpillar in folded leaf; 2, enlarged view of head and anterior joints; 3, ehrysalis; 4, male moth; 5, female moth.

Fig. 25. Grape-vine Epimenis ($Psychomorpha\ epimenis$, Drury); a, larva; b, side view of one segment, enlarged; c, hump on 11th joint, enlarged.

Fig. 26. Grape-vine Epimenis (Psychomorpha epimenis, Drury), moth, male.

Fig. 27. Grape-vine Plume (Pterophorus periscelidactylus Fitch); a, eaterpillars in their retreat; b, ehrysalis; c, one of the dorsal processes of ehrysalis; d, moth; one joint of larva enlarged, side view.

Fig. 28. Yellow-bear Caterpillar (Spilosoma virginica, Fabr.); a, eaterpillar; b, chysalis; c, moth.

Fig. 29. Smeared Dagger (Acronycta oblinita, Sm. & Abb.); a, eaterpillar; b, eoeoon; c, moth.

Fig. 30. Alciodes Rileyi Cress.; hardened skin of caterpillar of the Smeared Dagger (Acronycta oblinita, Sm. & Abb.) from which the Alciodes has emerged.

Fig. 31. Pyramidal Grape-vine Worm (Amphipyra pyramidoides Guen.), moth.

Fig. 32. Pyramidal Grape-vine Worm (Amphipyra pyramidoides Guen.).

Fig. 33. Grape-root Borer (Egeria polistiformis Harr.); a, male; b, female.

Fig. 34. Spotted Pelidnota (*Pelidnota punctata*, Linn.); a, larva; b, pupa; c, beetle; d, anal joint of larva; e, antenna of larva; f, leg of larva.

Fig. 35. Grape-vine Flea-beetle (Haltica chalybea Illiger); a, larvæ on leaf; b, larva, enlarged; c, earthen eell containing pupa; d, beetle. [d after Harris.]

Fig. 36. Grape-vine Flea-beetle (Haltica chalybea Illiger). [From Practical Entomologist.]

Fig. 37. Grape-vine Colaspis (Colaspis flavida Say); 1, enlarged; 2, natural size.

Fig. 38. Grape-vine Colaspis (Colaspis flavida Say); a, enlarged side view of larva; b, terminal joints seen from beneath.

Fig. 39. Galls of the Grape Phylloxera (Phylloxera vitifolia, Fitch = rastatrix Pl.).

- Fig. 40. Grape Phylloxera (Phylloxera ritifoliae, Fitch = Ph. vastatrix Pl.); a, the winged female; b, her foot or tarsus—after Signoret; c, egg; d, newly-hatched gall-inhabiting type; e, same, dorsal view; f, section of gall; g, tubercled root-inhabiting form; h, mother gall-louse at height of her fertility; i, same, dorsal view; j, k, differently veined wings of the Oak Phylloxera of Europe.
- Fig. 41. Great Lebia (Lebia grandis Hentz.).
- Fig. 42. Boll-worm (Heliothis armigera Hübn.) on tomato.
- Fig. 43. Boll-worm (*Heliothis armigera* Hübn.); a, egg, side view; b, egg, top view; c, caterpillar; d, chrysalis in carthen cocoon; e, moth, wings expanded; f, moth, wings closed. [a, b, c, d after Glover.]
- Fig. 44. Army-worm (Leucania unipuneta Haw.).
- Fig. 45. Fall Army-worm (Prodenia autumnalis Riley=Laphygma frugiperda, Sm. & Abb.); a, natural size: b, head magnified; c, one segment enlarged, from above; d, same, from side.
- Fig. 46. Fall Army-worm (*Prodenia autumnalis* Riley=Laphyjma frugiperda, Sm. & Abb.): a, b, c, three varieties.
- Fig. 47. Army-worm Moth (Leucania unipuncta Harr.).
- Fig. 48. Spiderwort Owlet-moth (Prodenia commelina, Abb.); a, caterpillar; b, c, dark and light varieties of the moth. [See Notes, etc., p. 56.]
- Fig. 49. Unarmed Rustie (Agrotis inermis Harr.=A. sancia Hübn.); a, egg, enlarged; b, batch of eggs, natural size.
- Fig. 50. Apple-tree Tent-caterpillar (Clisiocampa americana Harr.); a, b, eaterpillars; c, eggs; d, cocoon.
- Fig. 51. Apple-tree Tent-caterpillar (Clisiocampa americana Harr.) moth.
- Fig. 52. Tent-eaterpillar of the Forest (Clisiocampa sylvatica Harr.); a, eggs; b, female moth; c, egg enlarged, top view; d, enlarged eggs, side view.
- Fig. 53. Tent-caterpillar of the Forest (Clisiocampa sylvatica Harr.).
- Fig. 54. Rummaging Ground-beetle (Calosoma scrutator, Fabr.).
- Fig. 55. Fall Web-worm (Hyphantria textor Harr.); a, eaterpillar; b, ehrysalis; c, moth.
- Fig. 56. Blue-spangled Peach-worm (Callimorpha fulvicosta Clem.); a, caterpillar; b, moth; c, one segment enlarged, side view; d, same, top view.
- Fig. 57. Ash-gray Pinion (Xylina cinerea Riley); a, worm in fruit; b, moth.
- Fig. 58. Glassy-winged Soldier-bug (Campyloneura vitripennis, Say).
- Fig. 59. Glassy-winged Soldier-bug (Campyloneura vitripennis, Say), pupa.
- Fig. 60. White-lined Morning Sphinx (Deilephila lineata, Fabr.), moth.
- Fig. 61. White-lined Morning Sphinx (Deilephila lineata, Fabr.), eaterpillar, light
- Fig. 62. White-lined Morning Sphinx (Deilephila lineata, Fabr.); caterpillar, dark form.
- Fig. 63. Archippus Butterfly (Danais archippus, Fabr.).
- Fig. 64. Archippus Butterfly (Danais archippus, Fabr.); a, egg, greatly enlarged; c, natural size; c, f, lateral and dorsal views of a segment of the larva in its first stage, enlarged; b, larva in act of casting its skin, to show how the flexible horns are folded (d).
- Fig. 65. Archippus Butterfly (Danais archippus, Fabr.), eaterpillar.
- FIG. 66. Archippus Butterfly (*Danais archippus*, Fabr.); a, b, c, successive stages in changing from caterpillar to chrysalis.
- Fig. 67. Archippus Butterfly (Danais archippus, Fabr.), chrysalis.
- Fig. 68. Disippus Butterfly (*Limenitis disippus*, Godt.), showing upper surface of left wing, and under surface on the right. [After Harris.]
- Fig. 69. Disippus Butterfly (Limenitis disippus, Fabr.); a, egg greatly enlarged; c, natural size; d, one cell of the egg-shell, greatly magnified; b, one segment of the larva, in its first stage.
- Fig. 70. Disippus Butterfly (*Limenitis disippus*, Fabr.); α, eaterpillar; b, chrysalis; c, hibernaculum; d, leaf cut for hibernaculum.

- Fig. 71. Disippus Butterfly (*Limenitis disippus*, Fabr.); a leaf eaten by the caterpillar.
- Fig. 72. Disippus Egg-parasite (Trichogramma? minuta Riley); a, fly with wings folded; b, front wing; c, hind wing; d, leg; e, antenna—all enlarged.
- Fig. 73. Microgaster militaris Walsh. [After Walsh.]

REPORT IV.

- Fig. 1. Perforated tin box for sifting paris green.
- Fig. 2. Creighton's "Improved Patent Insect Destroyer."
- Fig. 3. Grand-Daddy-Long-Legs (Phalangium dorsatum Say).
- Fig. 4. Fifteen-spotted Ladybird (Mysia 15-punctata, Oliv.); a, larva; b, pnpa; c, first joint of larva, enlarged; d, e, f, g, different varieties of the beetle.
- Fig. 5. Icy Ladybird (Hippodamia glacialis Fabr.).
- Fig. 6. Ring-banded Soldier-bng (Perillus circumcinetus Stâl); b, antenna; c, beak (enlarged).
- Fig. 7. Dotted-legged Plant-bug (Euschistus punctipes, Say); c, beak (enlarged).
- Fig. 8. Spined Soldier bug (Arma spinosa Dallas); a, beak (enlarged).
- Fig. 9. Spined Soldier-bug (Arma spinosa Dallas); a, pupa; b, larva; c, egg (all enlarged).
- Fig. 10. Rove-beetle (Philonthus apicalis, Say).
- Fig. 11. Rove-bectle larva (Goërius olens). [After Westwood.]
- Fig. 12. Rove-beetle (Quedius molochiuus, Grav.), pupa.
- Fig. 13. Wier's Apple-worm Trap.
- Fig. 14. Pennsylvania Soldier-beetle (Chauliognathus pensylvanicus DeG.); a, larva; b, head and prothorax, enlarged; c, labium; d, labrum; e, leg; f, maxilla; g, antenna; h, mandible.
- Fig. 15. Two-lined Soldier-beetle (*Telephorus bilineatus*, Say); a, larva; b, anterior joints enlarged; c, beetle.
- Fig. 16. Grape-vine Colaspis (Colaspis flavida Say); one joint of larva, viewed from beneath and enlarged; b, head of larva, from beneath; c, same, from above, enlarged.
- Fig. 17. Harlequin Cabbage-bug (Strachia histrionica Hahn); a, larva; b, pupa; c, eggs: d, eggs enlarged, side view; e, same, top view; g, bug; h, same, with wings expanded.
- Fig. 18. Rascal Leaf-crumpler (*Phycita nebulo* Walsh); a, case, containing caterpillar; b, cases in winter; c, head and thoracic joints of larva, enlarged; d, moth.
- Fig. 19. Larval cases of the Rascal Leaf-erumpler (Phycita nebulo Walsh) in winter.
- Fig. 20. Walnut Case-bearer (Aerobasis juglandis LeBaron); a, case between two leatlets; b, case; c, wings of nebulo for comparison; d, wings of moth; c, wings of a variety of same from the crab-apple.
- FIG. 21. Apple-leaf Skeletonizer (Pempelia Hammondi Riley); a, larva; b, middle joint, enlarged; c, anterior joints, enlarged; d, moth.
- Fig. 22. Green Apple-leaf-tyer (Tortrix cinderella Riley); a, caterpillar; b, chrysalis; c, moth; d, pupal case.
- Fig. 23. Apple-leaf Bucculatrix (*Bucculatrix pomifoliella* Clem.); a, cocoons on twig: b, cocoon, enlarged; c, moth.
- Fig. 24. Apple-twig Borer (Bostrichus bicaudatus, Say). [After Walsh.]
- Fig. 25. Apple-twig Borer (Bostrichus bicaudutus, Say); twigs bored by this insect.
- Fig. 26. Red-shouldered Sinoxylon (Sinoxylon basilare, Say); a, larva; b, pupa; c, beetle.
- Fig. 27. Red-shouldered Sinoxylon (Sinoxylon basilare, Say); a, head and thoracic joints of larva greatly enlarged; b, labrum and mandibles; c, anterior leg; d, intermediate leg; e, posterior leg.

- Fig. 28. Grape Phylloxera (Phylloxera vitifoliae, Fitch = Ph. rastatrix Pl.); a, shows a healthy root; b, one on which the lice are working, representing the knots and swellings caused by their punctures; c, a root that has been deserted by them, and where the rootlets have commenced to decay; d, d, d, shows how the lice are found on the larger roots; e, female pupa, dorsal view; f, same, ventral view; g, winged female, dorsal view; h, same, ventral view; i, magnified antenna of winged insect; j, side view of the wingless female, laying eggs on roots; k, shows how the punctures of the lice cause the larger roots to rot.
- Fig. 29. Mulberry Silkworm (Bombyx mori Linu.), larva.
- Fig. 30. Mulberry Silkworm (Bombyx mori Linn.), cocoon.
- Fig. 31. Mulberry Silkworm (Bombyx mori Linn.), moth.
- FIG. 32. Mulberry Silkworm (Bombyx mori Linn.), coeoons; a, White French Annual; b, Yellow French Annual; c, Green Japanese Annual; d, White Japanese Annual; e, White Chinese Annual.
- Fig. 33. Ceeropia Silkworm Moth (Attacus Cecropia Linn.).
- Fig. 34. Cecropia Silkworm (Attacus Cecropia Linn.), cocoon.
- Fig. 35. Cecropia Silkworm (Attacus Cecropia Linn.), chrysalis.
- Fig. 36. Ceeropia Silkworm (Attacus Ceeropia Linn.).
- Fig. 37. Ophion macrurum, Linn. [After Packard.]
- Fig. 38. Ophion macrurum, Linu., larva.
- Fig. 39. Mary Chaleis-fly (Chaleis maria Riley).
- Fig. 40. Ceeropia Cryptus (Cryptus samiae Pack.), cocoons within the larger Ceeropia cocoon.
- FIG. 41. Ceeropia Cryptus (Cryptus samiæ Paek.); a, female; b, female abdomen of C. nuncius; c, male abdomen; d, highly magnified piece of wing.
- Fig. 42. Ailanthus Silkworm (Attacus cynthia, Hiibn.); 1, caterpillar; 2, moth; 3, cocoon; 4, chrysalis; 5, eggs.
- Fig. 43. Promethia Silkworm (Attacus promethea Drury); a, third stage; b, head in fourth stage, enlarged; c, lateral view of a joint in fourth stage, enlarged; d, full-grown caterpillar.
- Fig. 44. Promethia Silkworm (Attacus promethea Drury), cocoon.
- Fig. 45. Promethia Moth (Attacus promethia Drury), male. [After Harris.]
- Fig. 46. Promethia Moth (Attacus promethea Drury), female. [After Harris.]
- Fig. 47. Lnna Moth (Attacus Luna Linn.). [After Harris.]
- Fig. 48. Luna Silkworm (Attacus Luna Linn.).
- Fig. 49. Luna Silkworm (Attacus Luna Linn.), eocoon. [After Harris.]
- Fig. 50. Polyphemus Moth (Attacus Polyphemus Linn.), male.
- Fig. 51. Polyphemus Moth (Attacus Polyphemus Linn.), female. [After Harris.]
- FIG. 52. Polyphemus Silkworm (Attacus Polyphemus Linn.). [After Trouvelot.]
- Fig. 53. Polyphenius Silkworm (Attacus Polyphenius Linn.), coeoon. [After Trouvelot.]
- Fig. 54. Polyphemus Silkworm (Attacus Polyphemus Linn.), ehrysalis. [After Trouvelot.]
- Fig. 55. Yama-maï Moth (Attacus yama-maï, Gnér.-Mén.), male.
- Fig. 56. Yama-maï Silkworm (Attacus yama-maï, Gnér.-Mén.); egg, natural size and enlarged; young caterpillar on leaf; full grown caterpillar at rest on twig.
- FIG. 57. Yama-maï Silkworm (Attacus yama-maï, Guér.-Mén.), at rest on leafy twig, at a. [After Adams.]
- Fig. 58. Yama-maï Silkworm (Attacus yama-maï, Guér.-Mén.), eocoon.
- Fig. 59. Cage for receiving the deposition of the eggs of Yama-maï Moth. [After Adams.]
- Fig. 60. Pernyi Moth (Attacus Pernyi, Guér.-Mén.).
- Fig. 61. Pernyi Silkworm (Attacus Pernyi, Guér.-Mén.); egg, natural size and enlarged eocoon.

- Fig. 62. Horned Passalus (Passalus cornutus Fabr.); a, larva; b, pupa; c, beetle: d. under side of three thoracic joints of larva, showing legs; e, metathoracic leg of larva.
- Fig. 63. Great Leopard-moth (Espantheria scribonia, Stoll.), a, caterpillar; b, one hair, enlarged.
- Fig. 64. Great Leopard-moth (Ecpantheria scribonia, Stoll.); a, female; b, male.
- Fig. 65. Isabella Tiger-moth (Arctia isabella, Smith); a, caterpillar; b, chrysalis; c, moth.
- Fig. 66. Acorn-moth (Holeocera glandulella Riley); a, caterpillar in acorn; b, perforated acorn; c, head and thoracie joints of caterpillar, enlarged; d, e, lateral and dorsal views of one segment of larva; f, moth; g, base of antenna of male.

REPORT V.

- Fig. 1. Pyramid, showing the nature of the mouth, the relative rank of the Orders and the affinitives of the Sub-orders of Insects.
- Fig. 2. Bald-faced Hornet (Vespa maculata Linn.). [After Sanborn.]
- Fig. 3. Goldsmith-beetle (Cotalpa lanigera, Linn.).
- Fig. 4. Deïopeia bella, Drury.
- Fig. 5. Dotted-legged Plant-bug (Euschistus punctipes, Say).
- Fig. 6. Buffalo Tree-hopper (Ceresa bubalus, Fabr.); a, side view; b, view from above.
- Fig. 7. Missouri Bee-killer (Asilus missouriensis Riley).
- Fig. 8. Differential Locust (Caloptenus differentialis Walk.).
- Fig. 9. Dragon-fly (Libellula trimaculata, DeGeer.) [After Sanborn.]
- Fig. 10. Hull's Curculio-catcher.
- Fig. 11. Butterfly net; b, hinge in the ring; c, ring folded; d, nut sunk and soldered into brass tube at end of handle; e, screw; f, tip of handle, showing attachment of the ring.
- Fig. 12. Butterfly net: a, ring: b, socket: c, cork plug.
- Fig. 13. Butterfly net, head for attaching the ring to the rod.
- Fig. 14. Poison-bottle for killing insects; a, wadding to keep the cyanide grains in
- Fig. 15. Chloroform in stoppered bottle with brush.
- Fig. 16. Chloroform in bottle with tube passing through the cork.
- Fig. 17, Method of pinning insects; a, beetle; b, bug.
- Fig. 18. Method of carding small insects.
- Fig. 19. Method of "setting" Lepidoptera on a spreading board.
- Fig. 20. Setting-needle.
- Fig. 21. Sections of framework of glass-covered volume to display showy insects; a, ends; b, front; c, back.
- Fig. 22. Foreeps for pinning insects.
- Fig. 23. Forceps for pinning insects.
- Fig. 24. Forceps for pinning insects.
- Fig. 25. Breeding-eage; a, bottom board; b, four-sided frame, with glass sides and door, fitting over a zine pan (ff) attached to the bottom board; c, cover fitting to the frame and having a wire gauze top; d, zinc tube attached in centre of the pan, to contain a bottle for the reception of the food plant; e, sand in the pan; gg, cross pieces for supporting the cage and to prevent
- warping.
- Fig. 26. Ring-legged Pimpla (Pimpla annulipes Br.), female; to the right a figure of the ovipositor to show the two inner rods; to the left the abdomen of the male.
- Fig. 27. Delicate Longsting (Macrocentrus delicatus Cress.); to the right the abdomen of the male.
- Fig. 28. Rust-red Social Wasp (Polistes rubiginosus St. Farg.); b, nest, the natural position being with the mouths of the cells down.

- Fig. 29. Apple-tree Tent-caterpillar (Clisiocampa americana Harr.), eggs.
- Fig. 30. Grape Phylloxera (Phylloxera vastatrix Plan.); a, b, peculiar pedunculated galls; c, gall just forming; d, same from beneath.
- Fig. 31. Oyster-shell Bark-louse (Mytilaspis pomicorticis Riley): a, male louse from beneath; b, same from above and with wings expanded; c, male scale; d, leg of male: e, portion of wing very highly magnified; f, one joint of male antenne (all highly magnified).
- FIG. 32. Oyster-shell Bark-louse (Mytiluspis pomicorticis Riley); anal joint of louse, with a more highly magnified segment of edge at b, and of a single pore at c; d, female louse; c, a section of its proboscis more highly magnified; g h f, female scale, b, first scale, q, second scale, f, third scale.
- Fig. 33. Mite (Dermaleichus?).
- Fig. 34. Aphelinus mytilaspidis LeBaron.
- Fig. 35. Pine-leaf Scale-insect (Mytilaspis pinifolia, Fitch...); a, scales on leaves of white pine; b, male scale; c, female scale from white pine; d, female scale from broader leaved pine (b, c and d, enlarged).
- Fig. 36. Pine-leaf Scale-insect (Mytilaspis pinifolia, Fitcli); male, highly magnified.
- Fig. 37. Painted Ladybird (Covcinella picta Randall); a, larva; b, beetle; c, beetle, enlarged.
- Fig. 38. Hickory Bark-borer (*Scolytus caryæ* Riley); 1, view of its galleries on the inside of the bark, showing the beetle in the central gallery and the larvæ at the ends of the side galleries; 2, burrows made by larger larvæ; 3, beetle, magnified and natural size; 4, larva, magnified and natural size; 5, pupa, magnified; 6, sculpture of elytra, magnified.
- Fig. 33. Rose Chafer (Macrodaetylus subspinosus, Fabr.), with the enlarged anterior tibia at the left.
- Fig. 40, Chineh-bug (Micropus leucopterus, Say).
- Fig. 41. False Chinch-bug (Nysius destructor Riley); a, potato leaf showing some effects of its punctures; b, pupa; c, mature bug.
- Fig. 42. Grape-vine Apple-gall (Vitis-pomum Walsh & Riley); a, exterior: b, section.
- Fig. 43. Gall-gnat (Cecidomyia salicis-strobiloides Walsh), a, female; b, male antennæ.
- Fig. 44. Grape-vine Filbert-gall (Vitis-coryloides W. & R.); a, anterior joints of larva, showing breast-bone; b, cluster of galls; c, section of single gall.
- Fig. 45. Grape-vine Tomato-gall (Vitis-tomatos Riley=Lasioptera vitis O. S., gall): a, section of a single swelling.
- Fig. 46, Grape-vine Trumpet-gall (Vitis-viticola Riley = Cecidomyia viticola O. S.)
- Fig. 47. Jumping Tree-cricket (Orocharis saltator Uhler) eggs in grape twig; a, eggs;
 b, punctures; c, egg, enlarged.
- Fig. 48. Jumping Tree-cricket (Orocharis saltator Uhler); a, female; b, male.
- Fig. 49. Snowy Tree-cricket (*(Ecantlus niveus Harr.*) eggs; a, punctures in twig; b, section of twig showing the eggs within; c, egg, enlarged; d, granulations at rounded end of egg, more highly magnified.
- Fig. 50. Buffalo Tree-hopper (Ceresa bubalus Fabr.) eggs in slits in the bark of a tree; a, one slit enlarged; b, natural size.
- Fig. 51. Buffalo Tree-hopper (Coresa bubalus, Fabr.); a, side; b, dorsal view.
- Fig. 52. Buffalo Tree-hopper (Ceresa bubalus, Fabr.); a, larva; b, pupa; c, ovipositor of the female, all enlarged.
- Fig. 53. Egg-punctures of Tree-hopper (?) on apple twigs; a, natural size; b, enlarged.
- Fig. 54. Frosted Lightning-hopper (*Paciloptera pruinosa*, Say) eggs; a, enlarged; b, in position within twig, enlarged; c, natural size.
- Fig. 55. Frosted Lightning-hopper (Paciloptera pruinosa, Say).
- Fig. 56. Egg-punctures of (?) Orchelimum glaberimum (Burm.).
- FIG. 57. Eggs of the Angular-winged Katydid (Microeentrus retinervis, Burm.); a, front;
 b, side view, just before hatching.

- Fig. 53. Eggs of the Angular-winged Katy lid (Microcentrus retinervis, Burm.); a, front; b, side view, soon after laid.
- Fig. 59. Eggs of the Broad-winged Katydid (*Platyphyllum concavum Harr.*); a, side; b, front view, enlarged; c, d, natural size.
- Fig. 60. Buck Moth (Hemileuca maia, Drury).
- Fig. 61. Buck Moth (Hemileuca maia, Drury) eggs.
- FIG. 62. Buck Moth (Hemileuca maia, Drury); a, full-grown larva; b, pupa; c, ordinary form of spine of larva in the first stage; d, branched spine on thoracic joints of same; c, form of spines in second stage of larva; f, g, spines of full-grown larva.
- Fig. 63. Io Moth (Hyperchiria Io, Fabr.), male.
- Fig. 64. Io Moth (Hyperchiria Io, Fabr.), female.
- Fig. 65. Io Moth (Hyperchivia Io, Fabr.), caterpillar.
- Fig. 66. Io Moth (*Hyperchiria Io*, Fabr.), spines in 1st (c), 2d (b), and 5th (a) stages of caterpillar.
- Fig. 67. Green- striped Maple-worm (Dryocamp a rubicunda, Fabr.); a, caterpillar; b, chrysalis; c, female moth.
- Fig. 68. Belvoisia bifasciata, Fabr.
- Fig. 69. Hellgrammite Fly (Corydalus cornutus, Linn.); a, larva; b, pupa: ε, male fly;
 d, outline of head and prothorax of female.
- Fig. 70. Hellgrammite Fly (Corydalus cornutus, Linn.); supposed eggs.
- Fig. 71. Hellgrammite Fly (Corydalus cornutus, Linn.), pupa.
- Fig. 72. Goat-weed Butterfly (*Paphia glycerium* Doubl.); a, leaf eaten by the larva (natural size); b, head of larva in the first stage; c, larva in third stage; d, head in second stage; e, head in fourth stage all enlarged.
- Fig. 73. Painted-wing Digger-wasp (Ammophila pictipennis Walsh).
- Fig. 74. Yucca-moth (Pronuba yuccasella Riley); a, head with pollen mass (1), (2) the maxillary tentacle, (3) the maxillae, (4) maxillary palpi, (5) antenna; b, maxillary palpi with tentacle; c, single spine from maxillary tentacle; d, maxillary palpus of male; e, wing scale; f, anterior leg; g, labial palpus; h, venation of anterior wing; i, venation of posterior wing, male; j, last joint of the abdomen of the female with the ovipositor exserted—all enlarged.
- Fig. 75. Yucca-moth (Pronuba yuccasella Riley); a, larva; b, moth with wings folded; c, female moth with wings expanded, (all natural size); d, side view of one joint of larva; ε, head of larva from below; f, same from above; g, leg of larva; h, maxilla; i, mandible; j, labial palpi and spinneret; k, antenna—all enlarged.

REPORT VI.

- Fig. 1. Potato-beetle Catcher. Made of five barrel hoops and four (BB. EE) barrel staves, covered with cotton cloth.
- Fig. 2. Grape Phylloxera (*Phylloxera vastatrix* Planchon), galls on the leaf, seen from beneath.
- Fig. 3. Grape Phylloxera (*Phylloxera vastatrix* Plan.); a, b, pedunculated galls; c, gall just forming; d, same from beneath.
- Fig. 4. Grape Phylloxera (*Phylloxera vastatrix* Plan.)—Type Gallicola; a, b, newly-hatched larva, ventral and dorsal view; c, egg; d, section of gall; e, swelling of tendril; f, g, h, mother gall-louse—lateral, dorsal and ventral views; i, her antenna; j, her two-jointed tarsus.
- Fig. 5. Grape Phylloxera (Phylloxera vastatrix Plan.)—Type Radicicola; a, roots of Clinton vine, showing relation of swellings to leaf galls, and power of resisting decomposition; b, larva as it appears when hibernating; c, d, antenna and leg of same; e, f, g, forms of more mature lice; h, granulations of skin; i, tubercle; j, transverse folds at border of joints; k, simple eyes.

- Fig. 6. Grape Phylloxera (Phylloxera vastatrix Plan.)—Type Radicicola; a, shows a healthy root; b, one on which the lice are working, representing the knots and punctures caused by their punctures; c, a root that has been deserted by them, and where the rootlets have commenced to decay; d, d, d, show how the lice are found on the larger roots; e, female pupa, dorsal view; h, same, ventral view; i, magnified antenna of winged insect; j, side view of the wingless female, laying eggs on roots; k, shows how the punctures of the lice cause the larger roots to rot.
- Fig. 7. Grape Phylloxera (Phylloxera vastatrix Plan.). Pterogostic characters; a, b, different venation of front wing; c, hind wing; d, e, f, showing development of wings.
- Fig. 8. Grape Phylloxera (*Phylloxera vastatrix* Plan.)—Type Radicicola; a, b, pupa and imago of a problematical individual or supposed male; c, d, its antenna and leg; e, vesicles found in abdomen.
- Fig. 9. Thrips, enlarged, wings at right more highly enlarged.
- Fig. 10. Lace-wing fly (Chrysopa sp.); a, eggs; b, larva; c, coeoon, the upper figure with the lid open after the fly has escaped; d, fly, the wings omitted on the left. [a, b, d, after Westwood.]
- Fig. 11. Ladybird (Hippodamia convergens Gué.); larva, pupa and beetle.
- Fig. 12. Syrphus larva; b, one joint enlarged.
- Fig. 13. Syrphus-fly (Helophilus latifrons Loew).
- Fig. 14. Insidious Flower-bug (Anthocoris insidiosus, Say).
- Fig. 15. Root-louse Syrphus-fly (Pipiza radicum W. & R.); a, larva; b, pupa; c, fly.
- Fig. 16. Phylloxera Mite (Tyroglyphus phylloxeræ Planchon & Riley); a, dorsal; b, ventral view of female; c, mouth parts; d, f, g, h, forms of tarsal appendages; c, ventral tubercles of male.
- Fig. 17. Hoplophora arctata Riley; a, b, c, d, e, different attitudes assumed by it; f, strongly magnified leg.
- Fig. 18. American Oak Phylloxera (Phylloxera Rileyi Lichtn.); a, pupa; b, winged females; c, antenna greatly enlarged; d, portion of infested leaf, under side.
- Fig. 19. American Oak Phylloxera (*Phylloxera Rileyi* Lichtn.); a, b, dorsal and ventral views of larva as seen hibernating; c, d, highly magnified leg and antenna of same
- Fig. 20. Grape-vine Epimenis (*Psychomorpha epemenis*, Drnry); a, larva; b, one joint. enlarged, side view; c, hump on joint 11.
- Fig. 21. Grape-vine Epimenis (Psychomorpha cpimenis, Drnry), male moth.
- Fig. 22. Beantiful Wood-nymph (Eudryas grata, Fabr.); a, full grown larva; b, one joint, enlarged, side view; c, cervical shield from behind; d, anal hump from behind; e, f, top and side views of egg.
- Fig. 23. Beautiful Wood-nymph (Eudryas grata, Fabr.), female moth.
- Fig. 24. Pearl Wood-nymph (Eudryas unio, Hiibn.), male moth.
- Fig. 25. Eight-spotted Forester (Alypia octomaculata, Fabr.); a, larva; b, one joint, enlarged, side view; c, female moth.
- Fig. 26. Red-legged Ham-beetle (Corynetes rufipes, Fabr.); a, larva: b, pupa; c, co-coon; d, beetle, enlarged; c, same, natural size; f, leg of larva; g, maudible, h, labium, i, maxilla, j, antenna, of larva—all enlarged.
- FIG. 27. Larder-beetle (Dermestes lardarius Linn.); a, larva; b, one of its barbed hairs:
 c, beetle.
- Fig. 28. Clover-hay Worm (Asopia costalis, Fabr.); 1, 2, larva; 3, cocoon; 4, chrysalis; 5, 6, moth with wings expanded, and closed; 7, worm covered with silken web
- Fig. 2). Legged Maple Borer (*Ejeria aeerni*, Clem.); a, a, larva, dorsal and lateral views; b, b, b, cocoons exposed by detachment of bark; c, moth; d, chrysalis skin as it is often left remaining in the hole of exit.

- Fig. 30. Raspberry-root Borer (. Egeria rubi Riley); a, male moth; b, female moth.
- Fig. 31. Northern Brenthian (*Eupsalis minuta*, Drury); a, larva; b, pupa; c, female beetle; d, head of male do.; f, leg of larva; g, head of larva, from in front; h, labium; i, labrum; j, mandible; k, maxilla; l, head from beneath, all of larva and enlarged; m, end of body of pupa, dorsal view.
- Fig. 32. Larva of Tenebrionid (?); b, front view of head; e, mandible; f, antenna; g, maxilla; h, labium; d, e, concave end of the body, full and side views.
- Fig. 33. Sumach Flea-beetle (Blepharida rhois, Forst.); a, egg; b, b, egg-masses, covered with exerement; c, c, c, c, larva; d, cocoon; e, pupa; f, beetle; g, antenna of larva; h, maxilla do.; i, mandible do.; j, labium do.; k, labrum do.; l, leg do.
- Fig. 34. Tiphia inoruata Say; a, perfect wasp; b, head or larva, enlarged; c, larva, ventral view; d, cocoon cut open.
- Report VI, p. 122. Jiggers (Leptus irritans Riley, to the right; L. americanus Riley, to the left).
- Fig. 35. White-grub Fungus (Torvnbia ravenelii, Berk.).
- Fig. 36. Dominican Case-bearer (Coscinoptera dominicana, Fabr.); a, larva extracted from case; b, do. with case; c, beetle, showing punctures; d, same, natural size; e, egg, enlarged; i, eggs, natural size; g, head of male beetle, enlarged; h, mandible of same, more enlarged; j, leg of larva, with the claw joint more enlarged; f, under side of larva; k, its mandible; l, maxilla, all enlarged.
- Fig. 37. Chlamys plicata, Oliv.; a, larva extracted from case, the figure at the right showing the larva in the case. [After Packard.]
- Fig. 38. Yucca-moth (*Pronuba yuccasella* Riley); m, female chrysalis; l, male chrysalis, the apical joints more highly enlarged and viewed from the side in lower figure.
- Fig. 39. Eyed Emperor (Apatura lycaon, Fabr.); a, eggs; b, larva; c, d, chrysalis, dorsal and lateral views; e, imago, male, the dotted line showing form of female—all natural size.
- Fig. 40. Eyed Emperor (Apatura lycaon, Fabr.); f, egg, magnified; g, larva, lateral view; h, imago, under side—natural size; i, j, k, l, m, the five different larval heads; n, o, dorsal and lateral views of one joint of larva—enlarged.
- Fig. 41. Tawny Emperor (Apatura hevse, Fabr.); a, eggs; b, larva; c, chrysalis; d, imago, male, the dotted line showing form of female all natural size.
- Fig. 42. Tawny Emperor (Apatura herse, Fabr.); g, larva, half grown, dorsal view; h, imago, male, under side—natural size; i, j, k, l, m, the five different heads of larva; n, o, dorsal and lateral views of one joint of larva; p, egg—enlarged; g, larva as when hibernating—natural size.
- Fig. 43. Eggs of the Angular-winged Katydid (*Microcentrus retinervis*, Burm.); a, front; b, side view, just before hatching.
- Fig. 44. Eggs of Angular-winged Katydid (Microcentrus retinervis, Burm.); a, front;
 b, side view, soon after laid.
- Fig. 45. Angular-winged Katydid (Microcentrus retinervis, Burm.); male wings closed.
- FIG. 46. Angular-winged Katydid (*Microcentrus retinervis*, Burm.); a, ovipositor of female, nat. size; b, tip of same, enlarged.
- Fig. 47. Angular-winged Katydid (Microcentrus retinervis, Burm.); female ovipositing.
- Fig. 48. Back-rolling Wonder (Antigaster mirabilis Walsh); a, female, wings expanded; b, same, side view, partly rolled up; c, same nearly rolled up; d, antenna of same.
- Fig. 49. Back-rolling Wonder (Antigaster mirabilis Walsh); a, eggs of Microcentrus from which it has issued; b, female pupa, ventral view; c, male fly; d, his antenna.
- Fig. 50. Narrow-winged Katydid (Phaneroptera curricanda, DeGeer); female. [After Harris.]

- Fig. 51. Narrow-winged Katydid (Phaneroptera curricauda DeGeer); a, ovipositor of female, nat. size; d, end of same, enlarged; c, anal appendage of male, side view; b, same, back view.
- Fig. 52. Broad-winged Katydid (*Platyphyllum concavum* Harr.); male (after Harris). [Adapted from Harris.]
- Fig. 53. Broad-winged Katydid (*Platyphyllum concavum* Harr.); a, ovipositor of female, nat. size; b, end of same, enlarged.
- Fig. 54. Eggs of Broad-winged Katydid (*Platyphyllum concavum* Harr.); a, side; b, front view—enlarged; c, d—natural size.
- Fig. 55. Oblong-winged Katydid (*Phylloptera oblongifolia*, DeGeer), ontline of female [adapted from Harris]; b, end of ovipositor, enlarged.

REPORT VII.

- Fig. 1. Gray's Improved Sprinkler, for the use of Paris Green water. [From inventor.]
- Fig. 2. Chineh-bug (Micropus leucopterus, Say).
- Fig. 3. Chinch-bug (Micropus leucopterus, Say); a, b, eggs; c, newly hatched larva; d, its tarsus; c, larva after first molt; f, same after second molt; g, pupa, the natural sizes indicated at sides; h, enlarged leg of perfect bug; j, tarsus of same still more enlarged; i, proboscis or beak, enlarged.
- Fig. 4. Chinch-bug (Micropus leucopterus, Say), short-winged form.
- Fig. 5. Spotted Ladybird (Hippodamia maculata, DeGeer). [From Practical Entomologist.]
- Fig. 6. Trim Ladybird (Coccinella munda Say).
- Fig. 7. Insidious Flower-bug (Authocoris insidiosus, Say).
- Fig. 8. Many-banded Robber (Harpactor cinctus, Fabr.); a, bug; b, its beak, enlarged.
- Fig. 9. False Chinch-bug (Nysius destructor Riley); b, pupa; c, mature bug.
- Fig. 10. Ash-gray Leaf-bug (Piesma cinerea Say).
- Fig. 11. Flea-like Negro-bug (Corimelæna pulicaria, Germar); natural size and enlarged.
- Fig. 12. Flat-headed Apple-tree Borer (Chrysobothris femorata, Fabr.); a, larva, dorsal view; b, pupa; c, swollen thoracie joints of larva from beneath; d, beetle.
- Fig. 13. Cherished Braeon (Bracon charus Riley).
- Fig. 14. Spring Canker-worm (Anisopteryx vernata, Peck); a, full grown larva; b, egg, enlarged, the natural size shown in the small mass at the side; c, d, one joint enlarged, side and dorsal views.
- Fig. 15. Spring Canker-worm (Anisopteryx vernata, Peck); a, male moth; b, female do.—natural size; c, joints of her antenne; d, joint of her abdomen, showing spines; e, her ovipositor—enlarged.
- Fig. 16. Spring Canker-worm (Anisopteryx vernata, Peek); front view of head.
- Fig. 17. Fall Canker-worm (Anisopteryx pometaria Harr.); a, b, egg, side and top views; c, d, side and top views of one joint of larva,—enlarged; e, batch of eggs; f, full grown larva; g, female chrysalis—natural size; h, top view of anal tubercle of chrysalis.
- Fig. 18. Fall Canker-worm (Anisopteryx pometaria Harr); a, male moth; b, female do.—natural size; c, joints of her antenne; d, joint of her abdomen—enlarged.
- Fig. 19. Phylloxera, Male (Phylloxera carywcaulis, Fitch?).
- Fig. 20. Grafting; a, b, incisions to receive the scion; d, scion; c, string to secure scion—to prevent phylloxera injury.
- Fig. 21. Grafting—to prevent phylloxera injury.
- Fig. 22. American Oak Phylloxera (*Phylloxera rileyi* Licht.); a, male, ventral view; b, genital organ; c, tarsus—all greatly enlarged.

- Fig. 23. Rocky Monntain Locast (Caloptenus sprctus Thomas); a, a, a, female in different positions, ovipositing; b, egg-pod extracted from ground, with the end broken open, showing how the eggs are arranged; c, a few eggs lying loose on the ground; d, e, shows the earth partially removed, to illustrate an eggmass already in place, and one being placed; f, shows where such a mass has been covered up.
- Fig. 24. Rocky Mountain Locust (Caloptenus spretus Thomas); anal characters of female, showing (horny valves of ovipositor; b, an upper valve; c, a lower valve—all enlarged.
- Fig. 25. Rocky Mountain Locust (Caloptenus spretus Thomas); a, a, newly hatched larva; b, full grown larva; c, pupa.
- Fig. 26. Red-legged Locast (Caloptenus femur-rubrum, DeG.).
- Fig. 27. Rocky Mountain Locust (Calopteuus spretus Thomas).
- Fig. 28. Rocky Mountain Locust (Caloptenus spretus Thomas); a, tip of abdomen of male, side view; b, c, hind and top views of tip—all enlarged.
- Fig. 29. Red-legged locust (Caloptenus femur-rubrum DeGeer); a, tip of abdomen of male, side view; b, c, hind and top view—all enlarged.
- Fig. 30. Migratory Locust of Europe (Edipoda migratoria Linn.).
- Fig. 31 (p. 142). Map of North America, illustrating the country east of the Rocky Mountains subject to the Ravages of the Rocky Mountain Locust.
- (Opposite p. 144.) Map of Missouri, illustrating the Locust Invasion of 1874.
- Fig. 32. Swarm of Locusts falling upon and devouring a wheat-field.
- Fig. 33. Differential Locust (Caloptenus differentialis, Walk.).
- Fig. 34. Two-striped Locust (Caloptenus bivittatus, Say).
- Fig. 35. Silky Mite (Trombidium sericeum Say); natural size shown at side.
- Fig. 36. Locust Mite (Astoma gryllaria LeBaron); greatly enlarged.
- Fig. 37. Mite parasitic on the House-fly (Trombidium muscarum Riley); enlarged.
- Fig. 38. Red tailed Tachina-fly (Exorista militaris Kirkp.)
- Fig. 39. Flesh-fly (Sarcophaga sarraceniæ Riley); a, larva; b, pupa; e, fly; d, head and prothoracic joints of larva, showing curved hooks, lower lip (more enlarged at g), and prothoracic spiracles; e, end of body of larva, showing stigmata (more enlarged at f), prolegs and vent; h, tarsal claws of fly with protecting pads; i, antenna of fly—all enlarged.
- Fig. 40. Seventeen-year Locust (Cicada septemdecim Linn.); one wing removed so as to show ovipositor, b; a, beak.

REPORT VIII.

- Fig. 1. Lebia grandis Hentz.
- Fig. 2. Peck's Spray Machine in operation. [From inventor.]
- Fig. 3. Spring Canker-worm (Paleaerita revnata, Peck); a, caterpillar; b, cggs, natural size, one enlarged; c, one joint of larva, enlarged, side view; d, same, dorsal view.
- Fig. 4. Fall Canker-worm (Anisopterys pometaria Harr.); a, b, egg enlarged, side and top views; $e, d, \operatorname{joint}$ of larva, enlarged, side and dorsal views; e, eggs , natural size; $f, \operatorname{caterpillar}$; g, female ; chrysalis; h, tip of chrysalis, enlarged.
- Fig. 5. Spring Canker-worm (Paleacrita vernata, Peck), female chrysalis, enlarged.
- Fig. 6. Fall Canker-worm (Anisopteryx pometaria Harr.); a, male, b, female chrysalis, enlarged; a dorsal view of the tip of each shown beneath.
- Fig. 7. Spring Canker-worm (*Paleacrita vernata*, Peck); a, b, venation of wings; c, one joint of male antenna, greatly enlarged.
- Fig. 8. Fall Canker-worm (Anisopteryx pometaria Harr.): a, b, venation of wings; e, d, one joint of male antennæ, greatly enlarged, side and under views.
- Fig. 9. Spring Canker-worm (Paleacrita vernata, Peck); a, male moth; b, female moth—nat. size; c, portion of antenna of female; d, one segment of female abdomen; e, ovipositor—enlarged.

- Fig. 10. Fall Canker-worm (Anisopteryx pometaria Harr.); a. male moth; b, female moth—nat. size; c, joints of female antenna; d, one joint of female abdomen—eularged.
- Fig. 11. Canker-worm Trap, consisting of a band of tin attached to a circle of muslin-
- Fig. 12. Canker-worm Trap, of tin and muslin; section. [From Country Gentleman.]
- Fig. 13. Cauker-worm Trap, of tin and muslin; section to show the mode of union of the tin and muslin. [From Country Gentleman.]
- Fig. 14. Canker-worm Trap, at base of tree—Section. [From Country Gentleman.]
- Fig. 15. Canker-worm Trap, at base of tree. [From Country Gentleman.]
- Fig. 16. Tent-caterpillar of the Forest (Clisiocampa sylvatica Harr.); a, eggs; b, female moth; c, egg, enlarged, top view: d, same, side view.
- Fig. 17. Tent-caterpillar of the Forest (Clisiocampa sglvatica Harr.).
- Fig. 18. Army-worm (Lencania unipuncta Haw.), male genitalia; A, end of body dended of hairs, showing the upper clasps protruding, and the natural position of the hidden organs by dotted lines; B, the organs extended; c, upper valves; d, lower valves; e, upper intermediate organ; f, penis; g, back view of upper intermediate organ; h, inner surface of upper valves—all enlarged.
- Fig. 19. Army-worm (Leucania unipuneta Haw.); a, b, end of abdomen of female denuded of scales, showing the ovipositor withdrawn and exserted; c, terminal joint of ovipositor; d, striations representing folds of the membrane, to facilitate expansion; e, f, retractile subjoints; h, eggs—all enlarged; g, eggs, natural size.
- Fig. 20. Army-worm (Leucania unipuncta Haw.), natural size when full grown.
- Fig. 21. Army-worm (Leucania unipuncta Haw.), chrysalis.
- Fig. 22. Army-worm (*Leucania unipuncta* Haw.); a, male moth; b, abdomen of female—nat. size; c, eye, d, base of male antenna; e, base of female antenna—enlarged.
- Fig. 23. Stalk-Borer (Gortyna nitela Guen.); a, terminal joints of female abdomen denuded to show the exserted ovipositor; b, view of the ovipositor from above.
- Fig. 24. Unarmed Rustic (Agrotis saucia Treit.); a, top view of egg, enlarged; b, batch of eggs enlarged. [See Notes, etc., p. 55.]
- Fig. 25. Unarmed Rustic (Agrotis saucia Treit.); a, ovipositor as it appears at the end of the abdomen; b, same when extended.
- Fig. 26. Fall Army-worm (*Laphygma frugiperda*, Sm. & Abb.); a, full grown worm, nat. size; b, head, front view; c, one joint of body, dorsal view; d, do., side view—cnlarged. [See Notes, etc., p. 56.]
- Fig. 27. Fall Army-worm (Laphygma frugiperda, Sm. & Abb.); a, the typical form; b, c, variations of wings.
- Fig. 28. Elongate Ground-beetle (Pasimachus elongatus Lec.).
- Fig. 29. Murky Ground-beetle (Harpalus caliginosus, Fabr.).
- Fig. 30. Fiery Ground-beetle (Calosoma calidum, Fabr.); a, larva; b, beetle.
- Fig. 31. Rummaging Ground-beetle (Calosoma scrutator, Fabr.). [After Harris.]
- Fig. 32. Red-tailed Tachina-fly (Exorista leucania Kirk.). [After Walsh.]
- Fig. 33. Yellow-tailed Tachina-fly (Exorista flavicanda Riley).
- Fig. 34. Microgaster militaris Walsh. [After Walsh.]
- Fig. 35. Glassy Mesochorus (Mesochorus vitreus Walsh). [After Walsh.]
- Fig. 36. Pezomachus minimus Walsh. [After Walsh.]
- FIG. 37. Pezomachus minimus Walsh, bunch of cocoons. [After Walsh.]
- Fig. 38. Ophion purgatus Say.
- Fig. 39. Rocky Mountain Locust (Caloptenus spretus Thomas): process of acquiring wings; a, pupa with skin just split on the back; b, the image extending; c, do., nearly out; d, do. with wings expanded; e, do. with all parts perfect.
- FIG. 40. Acridium americanum, Drury.
- Fig. 41. Coral-winged Locust (Edipoda phanicoptera Germ.).

- Fig. 42. White-lined Morning Sphinx (Deïlephila lineata Fabr.), green larva.
- Fig. 43. White-lined Morning Sphinx (Deilephila lineata Fabr.), black larva.
- Fig. 44. White-lined Morning Sphinx (Delephila lineata Fabr.).
- Fig. 45. Lubber Locust (Brachypeplus magnus Gir.).
- Fig. 46. Green-striped Locust (Tragocephala viridifasciata); a, pupa; b, perfect insect.
- Fig. 47. Granulated Grouse-locust (Tettix granulata Scudder).
- Fig. 48. Grape Phylloxera (*Phylloxera vastatrix* Plan.); a, female, ventral view, showing egg through transparent skin; b, do. dorsal view; c, greatly enlarged tarsus; d, shrunken anal joints as they appear after oviposition; c, male of *Ph. earyweaulis*, Fitch?, dorsal view—the dots in circle indicating natural size.
- Fig. 49. Yucca Borer (Megathymus yucca, Walk.); a, a, funnels made by the larva; b, under ground stem, showing tunnelings of larva.
- Fig. 50. Yueea Borer (Megathymus yuccar, Walk.), female moth.
- Fig. 51. Yueca Borer (Megathymus yucca, Walk.); a, egg, side view, enlarged; b, egg from which the larva has hatched; bb, bbb, unhatched eggs—natural size; c, newly-hatched larva, enlarged; c c, full-grown larva, natural size; d'underside of head of same, enlarged to show the trophi.
- Fig. 52. Yueca Borer (Megathymus yucca, Walk.), pupa.
- Fig. 53. Yucca Borer (Megathymus yucca, Walk.), moth walking.
- Fig. 54. Yueca Borer (Megathymus ynecw, Walk.); a, b, venation of front and hind wings; c, labial palpus denuded; d, club of antenna; c, f, g, front, middle and hind legs,—all but wings enlarged.
- Fig. 55. Castnia phalaris (Fabr.), venation.

REPORT IX.

- Fig. 1. Gooseberry Span-worm (Enfitchia ribearia, Fitch.); a, b, larvæ; c, pupa.
- Fig. 2. Gooseberry Span-worm (Enfitchia ribearia, Fitch), female moth.
- Fig. 3. Gooseberry Span-worm (Enfitchia ribearia, Fitch); a, egg, enlarged; b, b, eggs, natural size.
- FIG. 4. Imported Currant-worm (Nematus ventricosus Klug); currant leaf showing eggs (1), and the holes which the young worms make (2, 3). [From Practical Entomologist.]
- Fig. 5. Imported Currant-worm (Nematus ventricosus Klug); a, a, a, larvæ; b, side view of one joint, enlarged, showing black tubercles.
- Fig. 6. Imported Currant-worm (Nematus ventricosus Klug); a, male fly; b, female fly.
- Fig. 7. Soldier-bug (Podisus placidus Uhler); a, enlarged; b, natural size.
- Fig. 8. Ovipositors of Sawflies; a, Willow-apple Sawfly (Nematus salicis-pomum Walsh); b, Currant-worm Sawfly (Nematus ventricosus Klug.), enlarged.
- FIG. 9. Native Currant-worm (Pristiphora grossulariæ Walsh); a, larva, nat. size; b, fly enlarged.
- Fig. 10. Strawberry-worm (Emphytus maculatus Nort.); 1, 2. ventral and lateral views of pupa; 3, enlarged sketch of perfect fly, the wings on one side detached; 4, larva crawling, natural size; 5, perfect fly with wings folded, natural size; 6, larva at rest; 7, cocoon; 8, antenna, enlarged; 9, egg, enlarged.
- Fig. 11. Abbot's Pine-worm (Lophyrus Abbotii Leach); 1, perfect fly, magnified; the left wings removed; 2, 3, ventral and lateral views of pupa, enlarged; 4, larvæ in different positions, nat. size; 5, cocoon, nat. size; 6, antenna of male, enlarged; 7, antenna of female, enlarged.
- Fig. 12. Map showing the distribution of the Colorado Potato-beetle (Doryphora decemlineata, Say).

- Fig. 13. Uropoda americana Riley; a, Colorado Potato-beetle attaeked by it—nat. size; b, the mite, ventral view, showing the penetrating organ lying between the legs; c, the organs extended; d, the claw; c, the excrematitious filament—all greatly enlarged.
- Fig. 14. Wheat-head Army-worm (*Lencania albilinea* Guen.); a, a, larvæ; b, eggs—nat. size; c, d, egg, top and side view—enlarged.
- Fig. 15. Wheat-head Army-worm moth (Lencania albilinea Guen.).
- FIG. 16. Map of North America, illustrating the country east of the Rocky Mountains overrun by the Rocky Mountain Locust in 1876.
- Fig. 17. Accidium americanum, Drnry.
- Fig. 18. Rocky Mountain Locust (Caloptenus spectus Thomas); a, a, a, female in different positions, ovipositing; b, egg-pod extracted from ground, with the end; c, a few eggs lying loose on the ground; d, e, shows the earth partially removed, to illustrate an egg-mass already in place and one being placed; f, shows where such a mass has been covered up.
- Fig. 19. Rocky Monntain Locust (Caloptenus spectus Thomas); Anal characters of female, showing horny valves of ovipositor; b, an upper valve; c, lower valve—all enlarged.
- Fig. 20. Rocky Mountain Loeust (Caloptenus spretus Thomas); oviposition—i, superanal plate; h, sponge-like exsertile organ—the egg passing through the horny valves of the ovipositor, g.
- Fig. 21. Rocky Mountain Locust (*Calopteuns spretus* Thomas), egg-mass, enlarged; *a*, side view within burrow, the line of exit of the young locusts shown at *d* and *e*; *b*, egg-mass from beneath; *c*, same from above.
- Fig. 22. Rocky Mountain Loenst (Calopteuns spretus Thomas); a, egg, enlarged to show senlpture of outer shell; b, portion of same very highly magnified; c, the inner shell, just before hatching; d, e, points where it ruptures.
- Fig. 23. Anthomyia Egg-parasite (Anthomyia radicum, Linn., var. calopteni Riley); fly; b, paparium; c, larva, side view; d, head of same, from above—enlarged.
- Fig. 24. Bombyliid larva (*Systechus* sp.); a, enlarged; b, head, side view, more enlarged; c, do., front view; d, posterior spiracle. [See Notes, etc., p. 60.]
- Fig. 25. Harpalus? larva; a, from above; b, head, from beneath; c, leg—enlarged;
 d, antenna; c, maxilla; f, labium.
- FIG. 26. Harpalus? larva; A, natural size; B, under side of head, enlarged; c, mandible; c, antenna; f, labium and labial palpi; g, maxilla and maxillary palpi; h, joint 12 beneath; i, joint 11 beneath; j, joints 4-10 each beneath—enlarged.
- Fig. 27. Pennsylvania Ground-beetle (Harpalus pensylvanicus, DeGeer).
- Fig. 28. Erax bastardi Maeq.; a, larva; b, pupa.
- Fig. 29. Amblychila cylindriformis Say.
- Fig. 30. Hellgrammite (Covydalus covnutus, Linu.); a, larva; b, pupa; c, fly, male; d, head of female fly.
- Fig. 31. Hellgrammite (Covydulus countus, Linn.); a, a, egg-masses attached; b, one detached, showing lower surface,—all rather below average size; c, a few eggs of the outer row; d, the newly-hatched larva; e, labium; f, anteuma; g, maxilla; h, mandible; i, tarsal elaw; j, anal hooks—all enlarged.
- Fig. 32. Eggs of Belostoma?
- Fig. 33. Gigantic Water-bug (Belostoma graudis Linn.).

CLASSIFIED LIST OF ILLUSTRATIONS.

The following list of illustrations, brought together in classificatory order, will prove serviceable to entomologists, as it will enable such to readily ascertain whether or not any particular insect of a particular Order has been figured in the Reports. The explanations to the figures are omitted, since they are already given in the preceding list. The nomenclature of the Reports is here, also, retained, and references to figures other than those of insects or their products are omitted. The number of the Report is indicated in Roman and of the figure in Arabic numerals.

HYMENOPTERA.

Ovipositors of Sawflies: IX, 8. Pristiphora grossulariæ Walsh: IX, 9. Nematus ventricosus Klug: IX, 4, 5, 6. Emphytus maculatus Nort.: IX, 10. Lophyrus Abbotii Leach.: IX, 11. Aphelinus mytilaspidis LeBaron: V, 34. Trichogramma? minuta Riley: III, 72. Autigaster mirabilis Walsh: VI, 48, 49. Chalcid sp.: I, pl. 2, Fig. 6. Glyphe viridascens Walsh: II, 24. Isosoma vitis Saunders: I, 73; II, 64. Isosoma hordei Harr.: II, 65. Eurytoma bolteri Riley: I, pl. 2, Figs. 8, 9; I, 97, Chalcis albifrons Walsh: II, 22. Chalcis mariæ Riley: IV, 39. Microgaster (= Apanteles): II, 48. Microgaster cocoons on Hog-caterpillar of the Vine (Chær. pampinatrix, Sm. & Abb.): II, 47. Microgaster militaris Walsh: I, 32; II, 23; III, 73; VIII, 34. Aleiodes Rileyi Cress.: III, 30. Bracon charus Riley: VII, 13. Macrocentrus delicatus Cress.: V, 27. Sigalphus curculionis Fitch: III, 7, 8. Pimpla annulipes Br.: V, 26. Cryptus samiae Pack.: IV, 40, 41. Hemiteles (?) cressonii Riley: I, pl. 2, Fig. 7.

Hemiteles (?) thyridopterygis Riley: I, pl. 2, Figs. 10, 11, 12.

Pezomachus minimus Walsh: II, 20, 21; VIII, 36, 37.

Porizon conotracheli Riley: III, 9.

Mesochorus vitrcus Walsh: II, 19; VIII, 35.

Ophion macrurum (Linn.): IV, 37, 38.

Ophion purgatus Say: II, 25; VIII, 38.

Tiphia inornata Say: VI, 34.

Ammophila pictipennis Walsh: V, 73.

Stizus grandis Say, ♀: I, 12.

Eumenes fraterna Say: II, 71.

Polistes rubiginosus St. Farg.: V, 28.

Vespa maculata Linn.: V, 2.

COLEOPTERA. Amblychila cylindriformis Say: IX, 29.

Tetracha virginica Hope: I, 59.

Calosoma serutator (Fabr.): II, 69: III, 54; VIII, 31.
Calosoma calidum (Fabr.): I, 34, 60; II, 70; VIII, 30.
Pasimachus elongatus Lec.: I, 61; VIII, 28.
Aspidoglossa subangulata Chand.: I, 21.
Lebia grandis Hentz: III, 41; VIII, 1.
Harpalus caliginosus Say: I, 62: VIII, 29.
Harpalus pensylvanicus (DeGeer): I, 23; IX, 27.
Harpalus? larva: I, 22; IX, 25, 26.

Quedius molochinus (Grav.): 1V, 12.

119

Cassida anrichalcea (Fabr.): II, 31, 33, 34. Gerius olens: IV. 11. Philonthus apicalis (Say): IV, 10. Dermestes lardarins Linn.: VI, 27. Hippodamia maculata (DeGeer): I, 29; II, 3; VII, 5. Hippodamia convergens Guer.: I, 52; VI, 11. Hippodamia glacialis (Fabr.): IV, 5. Hippodamia 13-punctata (Linn.): I, 51. Coccinella 9-notata Herbst: I, 50. Coccinella munda Say: II, 4; VII, 6. Coccinella pieta Randall: V, 37. Mysia 15-punctata (Oliv.): IV, 4. Chilocorus bivnlnerns Muls.: I, 4, 5. Ladybird larva: I, 53. Passalus cornutus Fabr.: IV, 62. Macrodactylus subspinosus (Fabr.): V, 39. Lachnosterna quercina (Knoch): I, 88. White Grub attacked by fungus: I, 89. Pelidnota punctata (Linn.): III, 34. Cotalpa lanigera (Linn.): V, 3. Chrysobothris femorata (Fabr.): I, 15, 16; VII, 12. Chauliognathus pensylvanicus (DeGeer): I, 19; IV, 14. Telephorus bilincatns (Say): IV, 15. Papilio philenor Drury: II, 84, 85, 86. Corynetes rufipes (Fabr.): VI, 26. Sinoxylon basilare (Say): IV, 26, 27. Bostrichus bicandatus (Say): IV, 24. Orthosema cylindrienni (Fabr.): I, 69. Prionns laticollis (Drury): I, 67; II, 60, 61, Prionns imbricornis (Linn.): II, 63. Saperda bivittata Say: I, 14. Bruchus pisi Linn.: III, 15, 16, 17. Brnchus granarius Linn.: III, 18. Bruchus fabæ Riley: III, 19. Lema trilincata (Oliv.): I, 42, 43. Coscinoptera dominicana (Fabr.): VI, 36. Chlamys plicata (Oliv.): VI, 37. Fidia viticida Walsh: I, 75. Colaspis flavida Say: III, 37, 38; IV, 16. Doryphora 10-lineata Say: I, 46. Doryphora juncta (Germar): I, 47. Diabrotica 12-punctata (Oliv.): II, 42. Diabrotica vittata (Fabr.): I, 44; II, 39, Haltica chalybea Illiger: III, 35, 36. Haltica cucumeris Harr.: I, 45. Blepharida rhois (Forst.): VI, 33. Chelymorpha cribraria (Fabr.): II, 28, 29. Physonota quinquepunctata Walsh & Riley: II, 30. Cassida nigripes Oliv.: II, 37, 38. Cassida bivittata Say: II, 27, 32.

Cassida guttata Oliv.: II, 35, 36. Deloyala clavata (Oliv.): II, 26. Larva of Tenebrionid (?): VI, 32. Lytta cinerea Fabr.: I, 40. Lytta vittata Fabr.: I, 39. Lytta marginata Fabr.: I, 41. Epicarus imbricatus (Say): III, 21. Ithycerns novæboracensis (Forster): III, 20 Anthonomus prunicida Walsh: III, 13. Anthonoums quadrigibbns Say: III, 10, 11. Conotrachelus nennphar (Herbst): I, 18;

III, 1, Conotrachelus cratægi Walsh: III, 12. Analcis fragariæ Riley: III, 14. Cæliodes inæqualis (Say): I, 70, 71, 72. Baridius trinotatus Say: I, 37. Baridius sesostris Lec.: I,74. Eupsalis minuta (Drury): VI, 31. Sphenophorus zew Walsh: III, 22. Sphenophorus pulchellus Schan.: III, 23. Scolytus caryæ Riley: V, 38.

LEPIDOPTERA.

Pieris protodice Boisd.: II, 72, 73, 74.

Pieris oleracea Boisd.: II, 75, 76. Pieris rapie Schrank.: II, 77, 78, 79. Danais archippus (Fabr.): III, 63, 64, 65, 66, 67. Limenitis disippus (Godt.): III, 68, 69, 70. Apatura lycaon (Fabr.): VI, 39, 40. Apatura herse (Fabr.): VI, 41, 42. Paphia glycerium Doubl.: II, 94, 95, 96; V, 72. Megathymus ynccae Walk.: VIII, 51,52, 53, 54. Castnia phalaris (Fabr.) venation: VIII, 35. Thyreus abboti Swainson: II, 54. Deilephila lineata (Fabr.): III, 60, 61, 62;

VIII, 42, 43, 44. Charocampa pampinatrix (Sm. & Abb.): II, 44, 45, 46.

Philampelus satellitia (Linn.): II, 52, 53. Philampelus achemon (Drury): II, 49, 50, 51.

Sphinx 5-maculata Haw.: I, 38. Ægeria exitiosa Say: I, 17. Ægeria polistiformis Harr.: III, 33. Ægeria rubi Riley: VI, 30. Ægeria acerni (Clem.): VI, 29.

Alypia octomaculata (Fabr.): I, pl. 1, Fig. 18; II, 55; VI, 25.

Psychomorpha epimenis (*Drury*): I, pl. 1, Fig. 19; III, 26; VI. 20, 21. Endryas unio (*Hübn.*): II, 57; VI, 24. Eudryas grata (*Fabr.*): II, 56; VI, 22, 23.

Procris americana Boisd: II, 58, 59.

Deïopeïa bella (Drury): V, 4.

Callimorpha fulvicosta Clem.: III, 56.

Arctia isabella (Smith): IV, 65.

Spilosoma virginica (Fabr.): III, 28.

Hyphantria textor *Harr.*: III, 55.

Eepantheria scribonia (Stoll): IV, 63, 64. Orgyia leucostigma (Sm. & Abb.): I, 81, 82, 83.

Thyridopteryx ephemeræformis *Haw.*: I, 81.

Bombyx mori Linn.: IV, 29, 30, 31, 32.

Attacns polyphemus *Liun.*: IV, 50, 51, 52, 53, 54.

Attacus luna Linn.: IV, 47, 48, 49.

Attacus yama-maï (*Guér-Mén.*): IV, 55, 56, 57, 58.

Attacus Pernyi (Guér-Mén.): IV, 60, 61. Attacus cynthia (Hübn.): IV, 42.

Attacus promethea Drury: IV, 43, 44, 45, 46.

Attacus cecropia Linn.: IV, 33, 34, 35, 36. Hemilenca maia (Drury): V, 60, 61, 62.

Hyperchiria io (*Fabr.*); V, 63, 64, 65, 66. Dryocampa rubicunda (*Fabr.*): V, 67.

Clisiocampa americana Harr.: III, 50, 51; V. 29.

Clisiocampa sylvatica *Harr.*: II, 11; III, 52, 53; VIII, 16, 17.

Acronycta populi Riley: II, 87, 88,

Aeronyeta oblinita (Sm. & Abb.): III, 29. Agrotis subgothica (Haw.): I, 29.

Agrotis jaculifera Guen.: I, pl. 1, Fig. 11. Agrotis scandens Riley: I, pl. 1, Figs. 5, 6, 7.

Agrotis cochranii Riley: I, 26.

Agrotis inermis *Harr.*: I, pl. 1, Figs. 1, 2, 3, 4.

Agrotis saucia Treit.: III, 49; VIII, 24, 25. Agrotis telifera Harr.: I, pl. I, Figs. 8, 9, 10; I, 28.

Noctua clandestina *Harr.*: I, pl. I, Fig. 13; I, 27.

Hadena subjuncta *Gr.* & *Rob.*: I, pl. I, Figs. 14, 15, 16, 17.

Agrotis devastator (Brace): I, 30.

Pupa of Cut-worm in earthen cell: I, 25. Mamestra pieta *Harr*.: II, 82.

Celæna renigera Steph.: I, 83.

Prodenia commeline (Sm. & Abb.): I, pl. I, Fig. 12; III, 48.

Gortyna nitela Guen.: I, 35, 36; VIII, 23.

Leucania albilinea Guen.: IX, 14, 15.

Lencania nnipuneta *Haw.*: II, 14, 15, 16; III, 47; VIII, 18, 19, 20, 21, 22.

Prodenia autumnalis Riley: III, 45, 46; VIII, 26, 27.

Amphipyra pyramidoides Guen.: III, 31, 32.

Anomis xylina (Say): II, 12, 13.

Xylina cinerea Riley: III, 57.

Plusia brassicæ Riley: II, 81.

Heliothis armigera Hübn.: 111, 42, 43.

Anisopteryx pometaria *Harr.*: VII, 17, 18; VIII, 4, 6, 8, 10.

Paleacrita vernata (*Peck*): VII, 14, 16; VIII, 3, 5, 7, 9.

Aplodes rubivora *Riley*: I, pl. 2, Fig. 25. Hæmatopis grataria (*Fubr.*): I, pl. 2, Figs. 18, 19, 20, 21.

Eufitchia ribearia (Fitch): IX, 1, 2, 3.

Asopia costalis (Fabr.): VI, 28. Pempelia Hammondi Riley: IV, 21.

Pempelia grossulariæ *Pack.*: I, pl. 2, Fig. 17; I, 79.

Phycita nebulo Walsh: IV, 18, 19.

Acrobasis juglandis LeBaron: IV, 20.

Galleria cereana Fabr.: I, 92.

Desmia maculalis Westw.: III, 24.

Phacellura nitidalis Cram.: II, 43.

Tortrix cinderella Riley: IV, 22.

Tortrix rileyana *Grote*: I, pl. 2, Figs. 3, 4; I, 85.

Penthina vitivorana *Pack.*: I, pl. 2, Figs. 29, 30; I, 76.

Euryptychia saligneana Clem.: II, 99.

Carpocapsa pomonella (Linn.): I, 24. Anchylopera fragariæ Walsh & Riley: I,

pl. 2, Figs. 26, 27; I, 80. Pronuba yuccasella *Riley*: V, 74, 75; VI,

38. Walshia amorphella Clem: 11,98.

Gelechia gallæsolidaginis Riley: I, pl. 2,

Figs. 1, 2; I, 96.
Holcocera glandulella *Riley*: IV, 66.

Bucculatrix pomifoliella *Clem.*: IV, 23. Pterophorus periscelidactylus *Fitch*: I, pl.

2, Figs. 15, 16; III, 27. Pterophorus cardui *Riley*: I, pl. II, Figs. 13, 14; I, 98.

HETEROPTERA.

Corimelæna pulicaria (Germar): II, 9; VII, 11.

Stiretrus fimbriatus (Say): I, 5, 6; II, 10. Perillus circumcinctus Stâl: IV, 6. Arma spinosa *Dallas*: I, 33, 54; II, 7; IV, 8, 9.

Podisus placidus Uhler: IX,7.

Euschistus punctipes, Say: IV, 7; V, 5.

Strachia histrionica Hahn: IV, 17.

Coreus tristis (DeGeer): I, 55.

Nysius destructor Riley: V, 41; VII, 9.

Micropus lencopterns (Say): II, 1, 2; V, 40; VII, 2, 3, 4.

Campyloneura vitripennis (Say): III, 58, 59.

Capsus oblineatus Say: II, 83.

Authocoris insidiosus (Say): II, 6; VI, 14; VII, 7.

Reduvius raptatorius Say: 1,5%.

Harpactor cinetus (Fabr.): I, 57; VII, 8.

Piesma cinerca (Say): II,8; VII, 10.

Belostoma grandis Linn.: IX, 33.

HOMOPTERA.

Cicada septemdecim Linn.: I, 6, 7, 13; VII, 40.

Cicada tredecim Linn.: I, 11.

Ceresa bubalus (Fabr.): V, 6, 50, 51, 52.

Peciloptera pruinosa (Say): V, 54, 55.

Pemphigus vagabnudus (Walsh): I, 65.

Eriosoma pyri Fitch: I, 64.

Phylloxera vastatrix *Planchon*: III, 39, 40; IV, 28; V, 30; VI, 2, 3, 4, 5, 6, 7, 8; VIII, 48.

Phylloxera caryacaulis (Fitch)?: VII, 19. Phylloxera rileyi Lichn.: VI, 18, 19; VII, 22.

Aspidiotus conchiformis (Gmélin): I, 2, 3; V, 31.

Mytilaspis pomicorticis *Riley*: I, 2, 3; V, 31, 32.

Aspidiotus harrisii (Walsh): I, 1.

Mytilaspis pinifolia (Fitch): V, 35, 36.

DIPTERA.

Gall, Vitis-tomatos Riley=Lasioptera vitis O.S.: V, 45.

Gall, Vitis-viticola *Riley*=Cecidomyia viticola O. S.: V, 46.

Gall, Cecidomyia salicis-strobiloides Walsh: V, 43.

Gall, Vitis-coryloides W. & R.: V, 44.

Gall, Vitus-pommm W. \mathcal{G} R.: V, 42.

Tabanus atratus Fabr.: II, 97.

Wing of Promachus (a), Asilus (b), Erax (e): II, 90.

Trupanea apivora Fitch: 1,93.

Erax bastardi Macq.: II, 92, 93; IX, 28.

Asilus missourieusis Riley: II, 89; V, 7.

Asilus sericens Say: II, 91.

Bombyliid larva (Systeehus sp.): IX, 24. Pipiza radicum W. & R.: I, 66; VI, 15.

Syrphus larva: VI, 12.

Helophilus latifrons Loew: VI, 13.

Œstrus ovis Linn.: I, 91.

Exorista leucaniæ Kirk.: II, 17: VII, 38; VIII, 32.

Exorista flavicauda *Riley*: II, 18; VIII, 33.

Lydella doryphorae Riley: I, 48.

Belvoisia bifasciata (Fabr.): V, 68.

Sarcophaga sarraceniæ Riley: VII, 39.

Anthomyia radicum (Linn.), var. calopteni Riley: IX, 23.

Anthomyia ze:e *Riley*: I, pl. II, Fig. 24; I, 86, 87.

Meromyza americana Fitch: I, pl. II, Fig. 28; I, 90.

ORTHOPTERA.

Œcanthus niveus Harr: I, 77, 78; V, 49.Orocharis saltator Uhler: V, 47, 48.

Phaneroptera curvicauda (DeGeer): VI,

50, 51.

Phylloptera oblongifolia (DeGeer): VI, 55. Microcentrus retinervis (Burm.): V, 57, 58; VI, 43, 44, 45, 46, 47.

Platyphyllum concavum Harr: V, 59; VI, 52, 53, 54.

Orchelimnin glaberrimum (Burm.): V, 56. Acridium americaunim (Drury): VIII, 40; IX, 17.

Caloptenus spretus *Thomas*: VII, 23, 24, 25, 27, 28; VIII, 39; IX, 18, 19, 20, 21, 22. Caloptenus femur-rubrum, *DeG.*: VII, 26, 29.

Caloptenus differentialis Walk.: V, 8; VII, 33.

Caloptenus bivittatus (Say): VII, 34.

Brachypeplus magnus Gir.: VIII, 45.

Œdipoda migratoria Linn.: VII, 30.

Œdipoda phœnicoptera Germ.: VIII, 41. Tragocephala viridifasciata Harr.: VIII,

46. Tettix granulata Sendder: VIII, 47. Mantis carolina (Linn.): I, 94, 95.

NEUROPTERA.

Libellula trimaculata (DeGcer): V, 9. Corydalus cornutus (Linn.): V, 69, 70, 71; IX, 30, 31.

Chrysopa sp.: I, 20; II, 5; VI, 10.

Thrips sp.: VI, 9.

ARACHNIDA.

Phalangium dorsatum Say: IV, 3.

ACARINA.

Trombidium muscarum Riley: VII, 37. Trombidium sericeum Say: VII, 35. Tyroglyphus phylloxeræ Planchon & Riley: VI, 16.

Nothrus ovivorus Pack.: II, 68. Leptus irritans Riley and L. americanus Riley: VI, p. 122.

Uropoda americana Riley: IX, 13.

Dermaleichus?: V, 33.

Astoma gryllaria LeBaron: VII, 36. Hoplophora arctata Riley: VI, 17.

GENERAL INDEX.

In this general index each report is referred to in Roman and the page in Arabic numerals. The index to the new matter of this Bulletin is also included and referred to by the abbreviation "Supp."

ERRATA.

Page III, line 9, for Classifed read Classified. Page 60, line 17, for LEUCANLE read LEUCANLE.

Pages 93, 94. In making up these pages several of the names got misplaced. "Orgyia" and "Thyridopteryx," on p. 94 should follow "Ecpantheria" on p. 93. "Haematopis," on p. 94, should follow "Eufitchia," on p. 93. "Pronuba" and "Galleria," p. 94, should follow "Carpocapsa," on the same page; "Œstrns" should follow "Pipiza" on the same page.

Page 94. After line 10 add "Geleehia gallæsolidaginis, larra and pupa: I, 173-174."
